

Workshop on:

Rainfall-Runoff Simulation Supporting with GIS and Satellite Data

Speaker:

Dr. ABOLGHASEM AKBARI

Faculty of Civil Engineering & Earth Resource, University Malaysia Pahang (UMP)

akhariinhox@vahon.com/akhari@umo.edu.mv

Date: 18-20 July 2016

Venue: FKASA 5, Level 1, Faculty of Civil Engineering & Earth Resources University of Malaysia
Pahang (UMP), 26300 Gambang, Kuantan, Malaysia

Watershed Modeling using HEC-GeoHMS

- Watershed boundary delineation
- Watershed parametrization

Digital Elevation Model (DEM)

with the invention of Geospatial Information Systems (GIS) and computer models, the role of digital elevation model (DEM) has become very important and effective tools in, Flood inundation process. Flood simulation mapping and landslide susceptibility mapping are as examples that effectively employ the DEM and its derivatives as one of the important modeling inputs. On the other hand, satellite based DEMs have been growing rapidly in recent years.

University Malaysia Pahang, Malaysi

Since Miller and Laflamme who coined the original term, other expressions such as $\ensuremath{\mathsf{DEM}},$

Digital Height Models (DHM),

Digital Surface Model (DSM), Digital Terrain Model (DTM),

Digital Terrain Model (DTM),
Digital Ground Models (DGM) and
Digital Terrain Elevation Model (DTEM),
have been used by Maidment, Djokic and Ye, Vieux and Li
et al. According to Li et al. the word DEM is widely used in
United States,

DHM in Germany,
DGM in the United Kingdom
and DTEM was introduced and is used by United States

Geological Survey (USGS)

Recommended DEM cell sizes and their range of applications (After Maidment)

Cell Size	Watershed Area (km²)	Typical Application
30 m	5	Urban watersheds
90 m	40	Rural watersheds
460 m	1000	River basins
930 m	4000	Nations
5.6 km	150,000	Continents
9.3 km	400 000	Global

Different sources of free satellite-based DEMs:

Different sources of free satellite-based DEMs :

ASTER Satellite Sensor Specifications

Launch Date	18 December 1999 at Vandenberg Air Force Base, California, USA
Equator Crossing	10:30 AM (north to south)
Orbit	705 km altitude, sun synchronous
Orbit Inclination	98.3 degrees from the equator
Orbit Period	98.88 minutes
Grounding Track Repeat Cycle	16 days
Resolution	15 to 90 meters

DEM Optimization Hydrologically adjusted DEM or called Agree-DEM

Basic stapes:

- Smoothing (using average filter)
 Majority filter (filling undefined pixels)
- Filling sinks
- Reconditioning

18-20 July 2016 ©Dr. A. Akbari

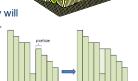

DEM creation results in artificial sinks in the landscape.

A sink is a set of one or more cells which has no downstream

cells around it.

Unless these sinks are filled they will isolate portions of the watershed.

Filling sinks is the first step for processing a DEM for watershed delineation.

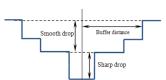

Profile view of sink in DEM (left) and filled depression of DEM (right)

	Buffer_dist	Smooth_drop	Sharp_drop
2	40	2.0	2.0
1	20	1.0	1.0

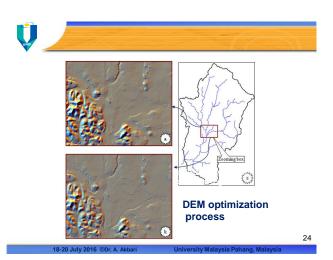

DEM reconditioning using attributes table of stream network

University Malaya/IOES Kuala Lumnur Malaysia

Exercise 2

- Open your ArcMap and active your HEC-GeoHMS extension
- Generate Agree-DEM for raw DEM provided on d:\data
- Delineate watershed boundary for the Klang Gates Dam watershed
- Calculate the following watershed characteristics for each subbasin:
 - (i) form factor,
 - (ii) compactness coefficient,
 - (iii) elongation ratio, and
 - (iv) circularity ratio.
