# WOULD I EVER USE A MAC COMPUTER ?

## Know the Macintosh

Would I ever use a Mac Computer? Or would you? Absolutely! Every body should use Macintosh. As everybody who tries to use it will turn to love it. Maybe everybody has been using a computer for quite of time. And most of the time it is Microsoft Window based operating systems.

## Know the Mac

Compare the Microsoft who sells Operating Systems (OS), Apple Computer turn out to be a computer maker and Operating systems developer. Their operating system is only capable to be run on Apple machines. So there is no issue of lack of support and hardware drivers.

### 1 Apple Machine

As a computer manufacturer, Apple computer have produce several lines of products [not taking in account mobile devices] from workstation into portable devices. Current line of product consist of: 1) iMac for all in one desktop processing and gaming station, 2) Mac Mini for a small budget with nothing short of amazing, 3) Mac Pro for a powerful graphic and

processor that will satisfy your professional need, 4) MacBook for elegant portable computing machines.

Originally most of the Apple machines were using PowerPC processor to power up their CPU. In 2007 Apple start releasing their product with Intel processor. A transition with a completely different architecture.

### 2 Operating Systems (OS)

Every Apple Computer comes with operating system that being build from the same manufacturer; you will never encounter any incompatible or hardware issue with the OS. Their OS can be categories into Classic (up to Mac OS 9) and Mac OS X. Each category comes from different root or development branch. Mac OS 9 is considered as the last operating systems that based from Apple original system.

Starting with Mac OS X v10.0 every thing is based on Unix OS variant; BSD with their own version called Darwin. As a POSIX compliant OS, you may be able to port any [or most] of the POSIX compliant software [unix/linux based software] that freely available in the Internet.
