

THE ENVIRONMENTAL IMPACT OF  
POLYCYCLIC AROMATIC  
HYDROCARBONS IN THE SEDIMENT  
RIVER

NURUL AIN BINTI ZAINODIN

Master of Engineering (Civil)

UNIVERSITI MALAYSIA PAHANG

## **SUPERVISOR'S DECLARATION**

I hereby declare that I have checked this thesis and in my opinion, this thesis is adequate in terms of scope and quality for the award of the degree of Master of Engineering in Civil.

---

(Supervisor's Signature)

Full Name : DR EDRIYANA BINTI A.AZIZ

Position : SENIOR LECTURER

Date :

## **STUDENT'S DECLARATION**

I hereby declare that the work in this thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at Universiti Malaysia Pahang or any other institutions.

---

(Student's Signature)

UNIVERSITI MALAYSIA PAHANG

FEBRUARY 2017

## **ACKNOWLEDGEMENTS**

First and foremost, I am thankful to Almighty Allah, most Gracious, who in His infinite mercy has guided me to complete this Master research work. May Peace and Blessings of Allah be upon His Prophet Muhammad (peace be upon Him).

I would like to express my sincere gratitude to my primary supervisor, Dr. Edriyana Abd. Aziz. Thanks for her guidance, encouragement, and critics that she has always shown to my work. Without her support and interest, this thesis would not be same as presented here.

I would also like to thanks to all laboratory staff at Environmental Laboratory of Civil Engineering and Earth Resources especially Mrs Azimah, Mrs Kamariah and Mr. Qari for providing me guidance during experimental works and the rest of my friends especially Wan Atikah and Nuri' Adilah, who had created pleasant and stimulating working conditions and has always given me encouragement to finish my master study.

Finally, a special thank you goes to my beloved parents Mr. Zainodin Omar and Mrs. Kamariah Ibrahim for always pray and inspires me a lot throughout this journey.

## ABSTRAK

Polisiklik Aromatik Hidrokarbon (PAH) adalah bahan yang berterusan ada dalam alam sekitar dan menjadi kebimbangan kerana ketoksikan dan mutagen bahan ini. Kehadiran PAH di Malaysia telah dilaporkan, dengan itu kajian ini dijalankan untuk menilai lagi kesan bahan ini kepada alam sekitar terutama dalam sedimen sungai dengan menentukan sifat PAHs dan faktor-faktor yang mengawalinya. Penyelidikan ini bermula dengan penyiasatan kapasiti penyerapan atau kemampuan PAHs ini dalam sedimen dan hubungan antara serapan dan pekali pembahagian oktanol-air mereka ( $K_{ow}$ ). Pekali partition oktanol-air ( $K_{ow}$ ) adalah peramal yang baik bagi serapan antara pencemar setelah keputusan menunjukkan bahawa pepejal air partition pekali ( $K_{oc}$ ) meningkat apabila pekali partition oktanol-air ( $K_{ow}$ ) meningkat. Data serapan telah digunakan bagi melakar graf Linear, Freundlich dan Langmuir model isoterma dan pekali linear regresi ( $R^2$ ) untuk Freundlich isoterma adalah yang tertinggi ( $>0.98$ ) di antara tiga model ini. Oleh itu, tingkah laku sorption yang PAH dalam sedimen sungai adalah 'physisorption' kerana ia patuh kepada model isoterma Freundlich. Kesan yang ketara ke atas PAH sifat telah diperhatikan dalam sedimen disebabkan oleh perubahan kemasinan, pH dan suhu yang ditunjukkan oleh pekali kapasiti penyerapan ( $K_f$ ) yang diperolehi daripada eksperimen. Pekali kapasiti penyerapan ( $K_f$ ) meningkat apabila kemasinan meningkat tetapi sebaliknya apabila pH dan suhu meningkat. 'pseudo-first order', 'pseudo-second order', 'Elovichs' equation' and 'fractional power' model telah di lakar dan 'pseudo-second order' di pilih mewakili penjerapan mekanisme kinetik kerana ia mempunyai pekali yang paling tinggi linear regresi ( $R^2 > 0.99$ ). 'Pseudo-second order' mengesahkan bahawa kehadiran liang dalam sistem sedimen adalah faktor pengehad kepada mekanisme kadar penjerapan. Selain itu, tiga kaedah yang berbeza digunakan bagi pengestrakan fasa pepejal untuk meningkatkan kepekatan sampel dan kaedah dari Supelco menunjukkan peratusan pemulihan tertinggi (73.53% kepada 88,29%) berbanding kaedah lain. Akhir sekali, hasil kajian ini juga menunjukkan perbezaan yang besar antara nilai-nilai eksperimen dan nilai-nilai yang dihasilkan oleh model pengiraan iaitu 'Estimation Program Interface' (EPISUITE). Oleh itu, kajian ini menunjukkan bahawa walaupun model pengiraan boleh digunakan tetapi ia tidak tepat menilai kesan alam sekitar daripada bahan pencemar. Eksperimen tetap perlu dilakukan untuk mendapatkan pembahagian sebenar PAH di dalam alam sekitar.

## ABSTRACT

Polycyclic Aromatic Hydrocarbons (PAHs) are ubiquitous in the environment and amongst greatest concern due to their toxicity and mutagenicity. As the occurrences of PAHs in Malaysia have been reported, thus this study was conducted to further assess their environmental impact in river sediments by determination of PAHs behavior and factors that govern it. The research started with the investigation of the sorption capacity or affinity of these PAHs in sediments and the relationship between sorption and their octanol-water partition coefficient ( $K_{ow}$ ). The octanol-water partition coefficient ( $K_{ow}$ ) was a good predictor of sorption among pollutant as the results show that the solid-water partition coefficient ( $K_{oc}$ ) increased as the octanol-water partition coefficient ( $K_{ow}$ ) increased. The sorption data was plotted to graphs Linear, Freundlich and Langmuir isotherm model and the linear regression coefficient ( $R^2$ ) obtained for Freundlich isotherm was the highest ( $>0.98$ ) among these three models. Thus, the sorption behavior of PAHs in river sediments was physisorption as it obeyed the Freundlich isotherm model. A significant effect on PAHs behavioral was observed in sediments caused by changes of salinity, pH and temperature which was indicated by the sorption capacity coefficient ( $K_f$ ) obtained from batch sorption equilibrium experiments. The sorption capacity coefficient ( $K_f$ ) increased as the salinity increased but vice versa as the pH and temperature was increased. The pseudo-first order, pseudo-second order, Elovichs' equation and fractional power model graphs was plotted and pseudo-second order represents the adsorption kinetic mechanism since it has the highest linear regression coefficient ( $R^2 > 0.99$ ). Pseudo-second order confirmed that presence of pores in the sediments system was the limiting factor to the adsorption rate mechanism. Besides that, three different method of solid phase extraction were applied to pre-concentrate the samples and the method from Supelco show the highest percentage of recovery (73.53% to 88.29%) compared to other method from previous literature. Finally, the results of this study also indicated a considerable difference between experimental values and values generated by the computational model, Estimation Program Interface (EPISUITE). Thus, this study strongly shows that although the computational model was indicative, it does not accurately assess the environmental impact of pollutant. The experiments need to be conducted to obtain the real partitioning of PAHs in environment.
