SUPERVISORS' DECLARATION

I hereby declare that I have checked the thesis and in my opinion, this thesis is adequate in terms of scope and quality for the award of the degree of Bachelor of Applied Science (Honor)Material Technology.

Signature
Name of Supervisor : SITI AISAH BINTI HARUN
Position : SUPERVISOR
Date :

STUDENT'S DECLARATION

I hereby declare that the work in this thesis is my own except for quotations and summaries which have been duly acknowledged. The thesis has not been accepted for any degree and is not concurrently submitted for award of other degree.

Signature :
Name : NURAZLIN BINTI AHMAD
ID Number : SC13008
Date :

DEDICATION

Dedicated to the strength of my life especially my family and friends. Thank you my parents, who have raised me to be the person I am today. You have been with me every step of the way, through good times and bad. Thank you for all the unconditional love, guidance, and support that you give me, helping me to succeed and instilling in me the confidence that I am capable of doing anything I put my mind to. Thank you for everything.

I also want to express the appreciation to my friends for nursing me with affections and love also their dedicated partnership for success in my life.

ACKNOWLEDGEMENTS

I would like to express my sense of gratitude to my beloved parents (father, Ahmad Bin Aziz and my mother, Homah binti Abdullah) for their endless support, guidance and sacrifice throughout my life. No words can describe how grateful I am to have them in my life.

I would also like to express my thanks, love, and respect to my supervisor, Mdm Aisah binti Harun for her helpful guidance, patience and constant consultation during this study. I am indebted to her who always encourages me, gives useful comments and valuable support until now. Thank you because you always put the trust on me to finish this project.

I also appreciate and special thanks to technical assistance in FIST Laboratory notably Miss Atiqah for her valuable support and assist me in many ways during my lab work. I also extend my sincere thanks to all the staff members who continuously welcome me every single time I came to the lab.

Last but not least, I want truthfully thank to my friends especially Khairunnisa binti Ibrahim and Syakila binti Sodikin for all encouraging conversations, continuous support and their help when I faced the difficult time during completing this thesis. This unforgettable memory I will keep in my mind until the end of my life.

ABSTRACT

Sodium Bismuth Titanate is a prominent candidate for a lead-free piezoelectric material. In this research, $\text{Na}_{0.5}\text{Bi}_{0.5}\text{TiO}_3$ was synthesized at different sintering temperature by sol-gel method in which the solutions were prepared by using sodium acetate CH_3COONa , bismuth (III) acetate $\text{Bi}(\text{CH}_3\text{COO})_3$, tetra-n-butyl titanate $\text{Ti}(\text{OC}_4\text{H}_9)_4$, as starting materials. Acetic acid glacial and 2-methoxyethanol as solvents and acetylacetone as a reagent to stabilize tetra-n-butyl titanate. The obtained BNT powder was analyzed using XRD, FESEM, FTIR. The mechanical properties of BNT was determined by hardness testing to investigate the strength of the samples. Pellets have been formed and sintered at 940 °C, 960 °C, 980 °C, 1000 °C for 5 hours. The XRD analysis confirmed that the perovskite structure was obtained at each temperature. The effect of slightly different sintering temperature on the structural was studied in detail. FESEM analysis of pellets showed the well-developed grains having larger size at higher sintering temperature. Hardness analysis that was examined by using Rockwell hardness testing shows that hardness measurement increased as the sintering temperature increased due to the amount of strain or defect content in the compact powders.

ABSTRAK

Natrium Bismut Titanate calon utama untuk bahan piezoelektrik bebas plumbum. Dalam kajian ini, $\text{Na}_{0.5}\text{Bi}_{0.5}\text{TiO}_3$ telah disintesis pada suhu pembakaran yang berbeza dengan kaedah cecair-gel di mana penyelesaian telah disediakan dengan menggunakan natrium asetat CH_3COONa , bismut (III) asetat $\text{Bi}(\text{CH}_3\text{COO})_3$, tetra-n-butyl titanat $\text{Ti}(\text{OC}_4\text{H}_9)_4$, sebagai bahan permulaan. Asid asetik glasier dan 2-methoxyethanol sebagai pelarut dan acetylacetone sebagai reagen untuk menstabilkan tetra-n-butyl titanat. Serbuk BNT yang diperolehi dianalisis menggunakan XRD, FESEM, FTIR. Sifat mekanik BNT ditentukan dengan ujian kekerasan untuk menyiasat kekuatan sampel. Pelet telah dibentuk dan dibakar pada suhu 940°C , 96°C , 980°C , dan 1000°C selama 5 jam. Analisis XRD mengesahkan bahawa struktur perovskit telah diperolehi pada setiap suhu. Kesan perbezaan suhu yang sedikit terhadap struktur sampel telah dikaji secara terperinci. Analisis FESEM pelet menunjukkan bijirin yang maju mempunyai saiz yang lebih besar pada suhu pembakaran yang lebih tinggi. Analisis kekerasan yang telah diperiksa dengan menggunakan ujian kekerasan Rockwell menunjukkan bahawa kekuatan sampel meningkat jika suhu pembakaran meningkat kerana jumlah ketegangan atau kandungan kecacatan dalam serbuk padat mempengaruhi kekuatan sampel.

CHAPTER 1

INTRODUCTION

1.1 BACKGROUND OF STUDY

Method for producing solid materials from little particles that contain multi-step process generally starts with the mixing of raw materials is called sol-gel process. This process is a technique that is used for creation of both ceramics or glassy materials. In ceramics processing, the irregular molecule sizes and shapes in powder often lead to non-uniform pressing morphologies that can cause packing density variations in the compaction of powder. Abandoned flocculation of powders because of the attraction of van der Waals forces also can increase the homogeneities of micro structural. The applications for sol-gel products are large. One of the application of ceramics in industry is thin films, which can be created on a piece of substrate by coating include dipping or spinning. Decorative or protective coating, and the components of electro-optic can be utilized with metal, glass and other types of substances by applying these methods. Dense ceramics or glass articles can be formed by cast into a mold, drying and heat treatment that cannot be produced by other methods. Electrophoresis, inkjet printing, spraying and roll coating are the other examples of coating methods. In this proposed research, sol gel process become the main idea because of it's advantages which are lower temperature processing, the particle size of samples is small and ability in controlling morphology in synthesizing powders. The samples can also be sintered at low temperature and the most important thing is sol-gel process shows better homogeneous final product that is formed compared to method of traditional ceramic.

1.2 PROBLEM STATEMENT

Most of ceramic materials made from lead-bearing compounds, for examples lead magnesium niobate (PMN) and lead zirconate titanate (PZT) (Aksel & Jones 2010). These compounds can effect environmental, health and social reasons. PZT based ceramics are environmentally burdened materials because of volatilization of toxic of lead oxide (PbO) during sintering at high temperature (Kim et al. 2003). Therefore researches now are in search to find good and environmentally friendly electroceramics with efficient ferroelectric properties that contain lead-free to reduce and ultimately eliminate the lead content of the materials.. BNT are expected to replace PZT among the lead-free piezoelectric ceramics due to the growing concern with environmental pollution. BNT also has received more attention compared to BaTiO₃ because BaTiO₃ has a relatively high sintering temperature during processing (Badapanda et al. 2013).

1.3 OBJECTIVES OF STUDY

Objectives of this research are:

1. To synthesis sodium bismuth titanate ceramics by using sol gel method at different sintering temperature.
2. To investigate the effect of temperature to the structural and mechanical properties of sodium bismuth titanate ceramics.

1.4 SCOPE OF STUDY

In this research, Sodium Bismuth Titanate (BNT) was synthesized and characterized by using the sol-gel technique starting with mixing the raw materials which were Sodium Acetate, Bismuth(III) acetate and Titanium(IV) butoxide. The mixture was then sintered at different sintering temperature which were 940 °C, 960 °C, 980 °C, and 1000 °C for five hours. The BNT ceramis were characterized by using X-Ray Diffractometer (XRD). The sintered pellets were observed under Field Emission Scanning Electron Microscopy Analysis Technique (FESEM) to measure the grain size

of the BNT. The samples also was characterized by FTIR to determine the functional group and the hardness testing to test the strength of ceramic
