# EVALUATION ON THE PERFORMANCE OF A SIGNALIZED INTERSECTIONS 

NOR AIN NADIA BINTI MOHAMAD ZAID

Thesis submitted in fulfilment of the requirements for the award of the degree of Bachelor of Civil Engineering

Faculty of Civil Engineering and
Earth Resources
UNIVERSITI MALAYSIA
PAHANG

JUNE 2017

## STATEMENT OF AWARD FOR DEGREE

## 1. Bachelor of Civil Engineering

Thesis submitted in fulfillment of the requirements for the award of the degree of Bachelor of Civil Engineering.

## SUPERVISOR'S DECLARATION

We hereby declare that we have checked this thesis and in our opinion, this thesis is adequate in terms of scope and quality for the award of degree of Bachelor of Civil Engineering.

Signature:
Name of Advisor: AZLINA BINTI HAJI ISMAIL
Position: LECTURER, FACULTY OF CIVIL ENGINEERING, UNIVERSITI MALAYSIA PAHANG

Date:

## STUDENT'S DECLARATION

I hereby declare that the work in this thesis is my own except for quotations and summaries in which have been duly acknowledged. The thesis has not been accepted for any degree and is not concurrently submitted for award of other degree.

Signature:
Name: NOR AIN NADIA BINTI MOHAMAD ZAID
ID Number: AA13213
Date:

## ACKNOWLEDGEMENTS

First of all I would like to say Alhamdulillah, thanks to Allah for giving me the strength, guidance and wisdom to complete my thesis. Without His guidance and favour, I might not be able to complete this thesis.

It is a matter of pleasure of acknowledgements by indebtedness to my supervisor, Madam Azlina Binti Haji Ismail for her patient, all the comments, encouragements, suggestions that helped me a lot in writing this thesis and completing the project. Then, also a special notes of thanks to my co-supervisor Dr Intan Suhana Binti Mohd Razelan for her assistant and advices throughout the project.

I would like to thank to faculty (FKASA) for providing the laboratory facilities for this project. I extend my gratitude to all my friends and others who provided assistances and supports.

Last but not least, gratitude goes to my family for their unlimited support including both emotionally and financially during completing this project and also thesis. Finally, I would like to thank everyone who had involved in this study either directly or indirectly.

#### Abstract

Intersection is where the vehicle from other direction meet. If the number of vehicle increase, this will cause a worst traffic flow when need to change the lane or direction during driving. Nowadays, traffic flow is the common problem occur not only in the urban but also in rural area due to the increases of vehicle. Therefore, this study is intended to evaluate the performance of a signalized intersection during weekdays and weekend in terms of level of service (LOS) at the intersection. In order to achieve this, the Tsignalized intersection that located at Batu 10, Jalan Gambang have been chosen as study area. The data collection will be recorded in several days during peak hour morning and evening on weekdays and weekend by manual count. Determination of traffic volume and geometric characteristic will figure out the delays and level of service (LOS). Based on the analyses, the cycle length and insufficient of lane cause the condition of this study area become worst. In order to improve the future operating level of service (LOS) the improvement that have been proposed are reduce the cycle length and make some change in the geometrical design such as added the number of lanes for the critical lanes. The improvement of the level of the service for the whole intersection will improve the performance of the intersection.

#### Abstract

ABSTRAK

Persimpangan adalah di mana kenderaan dari arah lain bertemu. Jika jumlah kenderaan meningkat, ini akan menyebabkan aliran trafik yang teruk apabila perlu menukar lorong atau arah semasa memandu. Pada masa kini, aliran trafik adalah masalah biasa yang berlaku bukan sahaja di bandar tetapi juga di kawasan luar bandar disebabkan oleh kenaikan kenderaan. Oleh itu, kajian ini bertujuan untuk menilai prestasi persimpangan berlampu isyarat pada hari bekerja dan hujung minggu dari segi tahap perkhidmatan (LOS) di persimpangan. Dalam usaha untuk mencapai matlamat ini, persimpangan $T$ yang berlampu isyarat yang terletak di Batu 10, Jalan Gambang telah dipilih sebagai kawasan kajian. Pengumpulan data akan direkodkan dalam beberapa hari pada waktu puncak pagi dan petang pada hari bekerja dan hujung minggu dengan kiraan manual. Penentuan jumlah trafik dan ciri-ciri geometri akan menentukan kelewatan dan tahap perkhidmatan (LOS). Berdasarkan analisis, panjang kitaran dan laluan yang tidak mencukupi menyebabkan keadaan kawasan kajian ini menjadi teruk. Dalam usaha untuk meningkatkan tahap operasi masa depan perkhidmatan (LOS) peningkatan yang telah dicadangkan adalah mengurangkan panjang kitaran dan membuat beberapa perubahan dalam reka bentuk geometri seperti menambah bilangan laluan untuk laluan kritikal. Peningkatan tahap perkhidmatan untuk seluruh persimpangan akan meningkatkan prestasi persimpangan.

## CHAPTER 1

### 1.1 INTRODUCTION

National Statistic Department Malaysia predicted that Malaysian population will be increase to 31.5 million in 2040. (Tan Sri Dato' Soong Siew Hoong, 2013). Of course each one of them will have their own dreams to buy own vehicle. In addition, this will influences the traffic flow since the number of vehicle on the road will increase along the time. It will also give the worst effect when it comes to the intersection. Intersection is where the vehicle from other direction meet. If the number of vehicle increase, this will cause a worst traffic flow when need to change the lane or direction during driving. Besides that, the congestion and accident also can happen due to the worst traffic flow especially during peak hour.

There are various type of intersection which are signalized intersection and unsignalized intersection. At the signalized intersection, traffic light will be used to control the movement of the vehicles. The problem of traffic light system is one of the factor that contribute to the traffic congestion. By referring to Dictionary.com, traffic lights which also can be known as traffic signal is a set of electrically operated signal lights used to direct or control traffic at intersections. Traffic control started to seem necessary in the late 1890s and Earnest Sirrine from Chicago patented the first automated traffic control system in 1910 which is used the words "STOP" and "PROCEED". (Mary Bellis, 2016). Therefore, the problem of traffic light system will increase the volume of the vehicle lineup and cause the congestion and delay happen.

Besides that, traffic signal is also important to reduce the number of vehicular traffic, delay, accident, utilization of police traffic and maintain the smooth of traffic flow. There are two types of traffic signal which are fixed timed and actuated signals. Fixedtime signals follow a predetermined sequence of signal operation, always providing the same amount of time to each traffic movement, whether traffic is present or not. Actuated
signals change the lights according to the amount of traffic in each direction. They use various types of sensors to detect vehicles, and adjust the length of the green time to allow as many vehicles as possible through the intersection before responding to the presence of vehicles on another approach. (WYDOT Quick Facts Traffic Signals, 2012).

The sequences of traffic signal are green, amber (yellow) and red. The green light means the driver can proceed their driving while the amber (yellow) light warns the driver to stop at the junction because the signal is about to change to red. Meanwhile, the red signal means the driver need to stop the vehicle in order to prevent the collision between the vehicles from other direction. In designing the traffic signal, guiding principles that must be followed are minimum number of phases, short cycle lengths and the level of service of signalized intersection must same as the road system. If there are problem with the traffic signals system, it can effected the traffic flow especially during peak hours.

### 1.2 PROBLEM STATEMENT

Nowadays, traffic flow is the common problem occur not only in the urban but also in rural area due to the increases of vehicle. Jalan Gambang - Kuantan at batu 10 which is at the intersection is getting congested especially during AM \& PM peak hours. Besides that, during festive season the road becomes more congested as it is the main road to Kuantan. This occur due the setting of signalized intersection that not suit with the volume. Most of the traffic get stuck and cannot proceed the driving. Only a few of them can proceed the driving. Therefore, the vehicle that are lineup will increase. This will affected the daily activities of the people as they wasted their time at the traffic light. This study was conducted to determine existing level of service of the signalized intersection during the peak hours. The study location of the T- signalized intersection is located at Batu 10, Jalan Gambang which is the major road to the Kuantan and near to the SMK Seri Mahkota. Figure 1.1 shown the location of the study area.

Figure 1.1: Study Area
(Sources Google Maps)

### 1.3 OBJECTIVE

The aim of this study is to determine whether the problem of traffic light system is the factor of the traffic flow problem at Jalan Gambang - Kuantan. The objective of this research are
i. To determine the existing level of service (LOS) of the signalized intersection during AM and PM peak hour.
ii. To propose possible mitigation measures in order improve the future operating level of service (LOS).

### 1.4 SCOPE OF STUDY

The scope of this research focused on the assessment of LOS in evaluating the performance of a signalized intersections. This is only limited to insolated signalized intersection. All the data will be taken during peak hour of weekdays (Monday to Friday) and weekend (Saturday and Sunday) within 7 to 10 AM \& 4 to 7 PM. The data that will be collected at the study area are geometric data, signalization data and traffic volume data. The data that obtained will be inserted into the input worksheet of MHCM 2006.

From the result get from the input worksheet, the existing of level of services (LOS) will be evaluated. Hence, the solution to improve the future operating level of service will be proposed.

## CHAPTER 2

## LITERATURE REVIEW

### 2.1 INTRODUCTION

All of the overall contents of this study were discussed from the problem statement, objectives and the scope in chapter 1. In order to understand this study, the literature reviews on several procedures and the discussion on the parameters are carries out in this chapter. Intersections studies were discussed in sections 2.2. Traffic flow characteristics at signalized intersection were discussed in sections 2.3 . Sections 2.4 were discussed about traffic light at signalized intersection. Capacity and level of service (LOS) were discussed in sections 2.5. In this section, the definition and the criteria of the level of service at the signalized intersection were highlighted. Besides that, the factor that affect the capacity and level of service also included in this section. Sections 2.6 were discussed about traffic volume studies that also included the type of traffic count.

### 2.2 INTERSECTION STUDIES

According to the American Association of State Highway and Transportation Officials' (AASHTO) A Policy on Geometric Design of Highways and Streets, an intersection is defined as the general area where two or more highways join or cross, including the roadway and roadside facilities for traffic movements within the area. (Golembiewski, G.A. and Chandler, B., 2011). Intersection are an important part of a highway facility because, to a great extent, the efficiency, safety, speed, cost of operation, and capacity of the facility depend on their design. (Warne, T.R., Carlson, D., King, L. 2001). The main objective of intersection design is to reduce the severity of potential conflicts between passenger cars, buses, trucks, bicycles and pedestrians. (A Guide to the

Design of At-Grade Intersections, 2015). Nevertheless, the single mistake from them can cause the accident that will influence the capacity of the road. The increasing of the capacity of the road will lead to the traffic congestion. Sometimes, the problem of the traffic light also can encourage the problem of traffic flow. Therefore, according to the accident and traffic congestion problem, it is important to engineer to study about the intersection.

### 2.3 TRAFFIC FLOW CHARACTERISTICS AT SIGNALIZED INTERSECTION

Three signal indicators that displayed at signalized intersection are green, yellow, and red. The red indication may include a short period during which all indications are red, referred to as an all-red interval, which with the yellow indication forms the change and clearance interval between two green phases. (John, D.Z., Richard, D., James, B., 2000). Figure 2.1 show some fundamental attributes of flow at signalized intersections. This figure implies at typical scenario of one-way approach to a signalized intersection with cycle of two phases. This figure have three parts where a time versus space graph of vehicles has been shown in first part. The intervals for the signal cycle are indicated in the diagram. Then, for the second part, the timing interval and the labels of time interval of interest with the symbol is shown. From the diagram, an idealized plot of flow rate passing the stop line, indicating how saturation flow is defined in third part.

Figure 2.1: Fundamental Attributes of Flow at Signalized Intersections
(Sources HCM 2000)

### 2.4 TRAFFIC LIGHT AT SIGNALIZED INTERSECTION

Highway Capacity Manual, 2000 state that a traffic signal, for example, limits the times available to various movement in an intersection. Capacity is limited not only by the physical space but by the time available for movements. The overall objective of signal control is to provide for a safe and efficient traffic flow through intersections, along routes and in road networks. At individual intersections, the primary purpose is to assign
right-of-way for alternate roads or road approaches in order to maximize capacity, minimize delay and reduce conflicts. (A Guide to the Design of Traffic Signals, 1987).

### 2.5 CAPACITY AND LEVEL OF SERVICE CONCEPT

Capacity and Level of service are two related terms. Capacity analysis tries to give a clear understanding of how much traffic a given transportation facility can accommodate. Level of service tries to answer how good the present traffic situation on a given facility is.

### 2.5.1 Capacity

Capacity at intersection is defined for each lane group. The lane group capacity is the maximum hourly rate at which vehicles can reasonably be expected to pass through the intersection under prevailing traffic, roadway and signalization conditions. Capacity is considered as the maximum capability of a given transportation mode or its particular component to serve a certain volume of demand, during a specified period of time, under given conditions. (Teodorovic, D., and Janic, M., 2017). The capacity of a signalized intersection is limited by the capacities of individual approaches to the intersection.

### 2.5.2 Level of Service

Level of service is defined as "a quality measure describing operational conditions within a traffic stream, generally in terms of service measures such as speed and travel time, freedom to maneuver, traffic interruptions, comfort and convenience." (John, D.Z., Richard, D., James, B., 2000). Determination of L.O.S. in urban areas is very much different from the concept applied in rural areas or uninterrupted roads. (Robin Babit, Viranta Sharma, Ajay K. Duggal, 2016). When a road is carrying traffic in equal volume to its capacity, or say volume to capacity ratio near to one, under ideal traffic and roadway conditions, the operating conditions become poor. (Robin Babit, Viranta Sharma, Ajay K. Duggal, 2016). Vehicular volume affects the efficiency and the Level of Service of an intersection. High traffic volume on the major road especially during peak hours, would invariably cause considerable delay for the traffic on the minor road. (A Guide to the

Design of Traffic Signals, 1987). Robin Babit, Viranta Sharma, Ajay K. Duggal, July 2016 state that the following are the factors which might be considered in evaluating the L.O.S.:
$>$ Traffic interruptions or restrictions, with due consideration to the number of stops per kilometer, changing of speed and delays involved are the requirement to maintain the speed in the traffic stream.
$>$ Speed and travel time, including the operating speed and overall travel time consumed in travelling over a section of roadway.
$>$ Driving comfort and convenience reflecting the roadway and traffic conditions in so-far as they affect driving comfort and convenience of the driver.
$>$ Freedom to maneuver to maintain the desired operating speeds.

Highway Capacity Manual (HCM) used travel speed and volume by capacity ratio ( $\mathrm{v} / \mathrm{c}$ ratio) to distinguish between various levels of service. The value of $\mathrm{v} / \mathrm{c}$ ratio can vary between 0 and 1.Depending upon the travel speed and v/c ratio, HCM has defined six levels of service, level A to level F based on a graph between operating speed and v/c ratio as shown in the Figure 2.2 (Tom V. Mathew and K V Krishna Rao, 2007).

Figure 2.2: Level of Service A to F

### 2.5.3 Types of Facilities

Since this study is conduct at the intersection, uninterrupted flow and interrupted flow are the most important classification of transportation facilities from the engineering perspective. They are determined based on the continuity of flow. Uninterrupted flow is the flow of traffic in which there is no obstructions to the movement of vehicles along the road such as traffic signals. Freeway is one example for this type of facility. Interrupted flow refers to the condition when the traffic flow on the road is obstructed due to some reasons. (Tom V. Mathew and K V Krishna Rao, 2007). Interrupted-flow facilities have controlled and uncontrolled access points that can interrupt the traffic flow. These access points included traffic signals, stop signs, yield signs, and other types of control that stop traffic periodically. HCM define level of service of freeway section as on Tables 2.1. Meanwhile Arahan Teknik (Jalan) 13/87 define level of service of signalized intersection and level of service of road as on Table 2.2 and Table 2.3. Table 2.4 show the definition of level of service for signalized intersection from A Guide to The Design of At-Grade Intersections.

Table 2.1: LOS for Freeway

| LOS | K(veh $/ \mathbf{k m} / \mathbf{l a n e})$ | FFS (Km/hr) | v/c |
| :---: | :---: | :---: | :---: |
| A | $0-7$ | 120 | 0.35 |
| B | $7-11$ | 120 | 0.55 |
| C | $11-16$ | 114 | 0.77 |
| D | $16-22$ | 99 | 0.92 |
| E | $22-28$ | 85 | 1.0 |
| F | $>28$ | $<85$ | $>1.0$ |

Table 2.4: Level of Service Definition for Signalized Intersections

## Level Of

## Intersection Conditions

## Service

A Very short delay and most vehicle do not stop as result of favorable progressions, arrival of most vehicles during green phase, and short cycle length.
B Short delay and many vehicles do not stop or stop for short time as a result of short cycle lengths and good progression.
C Moderate delay, many vehicle have to stop, and occasional individual cycle failures as a result of some combination of long cycle lengths, high volume to capacity ratios, and unfavorable progressions.
D Longer delay; many vehicle have to stop; and a noticeable number of individual cycle failures as a result of some combination of long cycle lengths, high volume to capacity ratios, and unfavorable progression.
E Long delays and frequent individual cycle failures result from one or both of the following: long cycle lengths or high volume to capacity ratios, which, in turn, result in poor progression.
F Delays considered unacceptable to most drivers occur when the vehicle arrival rate is greater than the capacity of the intersection for extended periods of times.
(Sources A Guide to The Design of At-Grade Intersections)

### 2.5.4 Factor Affecting LOS and Capacity

Highway Capacity Manual 2010 (HCM) define that the factor that affecting the level of service (LOS) and capacity consist of base condition, roadway condition and traffic condition.

### 2.5.4.1 Base Condition

Base condition assume good weather, good pavement conditions, users familiar with the facility, and no impediments to traffic flow. Example of base conditions for intersection approaches are given below:

- Lane widths of 3.6 m ,
- Level grade,
- No curb parking on the approaches,
- Only passenger cars in the traffic stream,
- No local transit buses stopping in the travel lanes,
- Intersection located in a non-central business district area, and
- No pedestrians.

In most capacity analyses, prevailing conditions differ from the base conditions, and computations of capacity, service flow rate, and level of service must include adjustment. Prevailing conditions are generally categorized as roadway, traffic, or control.

### 2.5.4.2 Roadway Conditions

Roadway conditions included geometric and other elements. Roadway factors included the following:

- Number of lanes,
- The types of facility and its development environment,
- Lane widths,
- Shoulder widths and lateral clearances,
- Design speed,
- Horizontal and vertical alignments, and
- Availability of exclusive turn lanes at intersections.

In general, the severity of the terrain reduces capacity and service flow rates. This is significant for two-lane rural highways, where the severity of terrain not only can affect
the operating capabilities of individual vehicles in the vehicles in the traffic stream, but also can restrict opportunities for passing slow-moving vehicles.

### 2.5.4.3 Traffic Conditions

Traffic conditions included the vehicle type and directional and lane distribution. The entry of heavy vehicles into the traffic stream affects the number of vehicles that can served. Heavy vehicles adversely affect traffic because they larger than passenger cars and occupy more roadway space and have poorer operating capabilities than passenger cars, particularly with respects to acceleration, deceleration, and the ability to maintain speed on upgrades. Directional distribution has a dramatic impact on two-lane rural highway operation, which achieves optimal conditions when the amount of traffic is about the same in each direction. Lane distribution also is a factor on multilane facilities. Typically, the shoulder lane carries less traffic than other lanes.

### 2.5.4.4 Control Conditions

For interrupted-flow facilities, the control of the time for movement of specific traffic flows is critical to capacity, service flow rates, and level of service. The most critical type of control is the traffic signal. The type of control in use, signal phasing, allocation of green time, cycle length, and the relationship with adjacent control measures affect operations. Stop signs and yield signs also affect capacity, but in a less deterministic way. In bus transit system, the buses has to stop at the bus bays and also it has to share the road with the other vehicles. Hence the capacity will be affected by the control characteristics and the traffic conditions prevailing in the road.

### 2.6 TRAFFIC VOLUME STUDIES

Traffic volume studies are conducted to determine the number, movements, and classifications of roadway vehicles at a given location. These data can help identify critical flow time periods, determine the influence of large vehicles or pedestrians on vehicular traffic flow, or document traffic volume trends. The length of the sampling period depends on the type of count being taken and the intended use of the data recorded.

For example, an intersection count may be conducted during the peak flow period. If so, manual count with 15 -minute intervals could be used to obtain the traffic volume data. (Traffic Volume Counts, n.d.).

### 2.6.1 Types of Traffic Counts

Dr. Brian Slack, 2013 and Guillaume Leduc, 2008 state that traffic count is divided into intrusive and non-intrusive method. In general the intrusive methods are used most widely because of their relative ease of use and because they have been employed for decades. The only widely used non-intrusive method is manual counting, which enjoys wide application because of its ease.

### 2.6.1.1 Intrusive method:

i. Pneumatic method: rubber tubes are placed across the road lanes to detect vehicles from pressure changes that are produced when a vehicle tyre passes over the tube. The pulse of air that is created is recorded and processed by a counter located on the side of the road. The main drawback of this technology is that it has limited lane coverage and its efficiency is subject to weather, temperature and traffic conditions. This system may also not be efficient in measuring low speed flows.
ii. Piezo-electric sensor: a device that is placed in a groove cut into the roadbed of the lane(s) being counted. This electronic counter can be used to measure weight and speed. Cutting into the roadbed can affect the integrity of the roadbed and decrease the life of the pavement.
iii. Inductive loop: a wire embedded in the road in a square formation that creates a magnetic field that relays the information to a counting device at the side of the road. This has a generally short life expectancy because it can be damaged by heavy vehicles, and is also prone to installation errors.

### 2.6.1.2 Non-intrusive method:

i. Manual counts: it is the most traditional method. In this case trained observers gather traffic data that cannot be efficiently obtained through automated counts e.g. vehicle occupancy rate, pedestrians and vehicle classifications. The most common equipment used are tally sheet, mechanical count boards and electronic count board systems.
ii. Passive and active infra-red: the presence, speed and type of vehicles are detected based on the infrared energy radiating from the detection area. The main drawbacks are the performance during bad weather, and limited lane coverage.
iii. Passive magnetic: magnetic sensors are fixed under or on top of the roadbed. They count the number of vehicles, their type and speed. However, in operating conditions the sensors have difficulty differentiating between closely spaced vehicles.
iv. Microwave radar: this technology can detect moving vehicles and speed (Doppler radar). It records count data, speed and simple vehicle classification and is not affected by weather conditions.
v. Ultrasonic and passive acoustic: these devices emit sound waves to detect vehicles by measuring the time for the signal to return to the device. The ultrasonic sensors are placed over the lane and can be affected by temperature or bad weather. The passive acoustic devices are placed alongside the road and can collect vehicle counts, speed and classification data. They can also be affected by bad weather conditions (e.g. low temperatures, snow).
vi. Video image detection: video cameras record vehicle numbers, type and speed by means of different video techniques e.g. trip line and tracking. The system can be sensitive to meteorological conditions.

Table 2.5: The type of variables provided by different type of detectors.

| Detector Type |  | Volume/ <br> Count | Speed | Classification | Occupancy | Presence |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I | Inductive Loop | $\checkmark$ | $\checkmark$ (1) | $\checkmark$ (2) | $\checkmark$ | $\checkmark$ |
|  | Magnetic | $\checkmark$ | $\checkmark$ (3) | $\checkmark$ (3) | $\checkmark$ | $\checkmark$ |
|  | Pneumatic Road Tube | $\checkmark$ | $\checkmark$ | $\checkmark$ | X | X |
| N | Active Infrared | $\checkmark$ | $\checkmark$ | $\checkmark$ | X | X |
|  | Passive Infrared | $\checkmark$ | $\checkmark$ (4) | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | Microwave Doppler | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | Radar True | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | Presence |  |  |  |  |  |
|  | Ultrasonic | $\checkmark$ | X | X | X | $\checkmark$ |
|  | Passive Acoustic | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | Video Image | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | Processing |  |  |  |  |  |

Note: (1) Speed can be measured by dual-loops with a known distance apart, or by algorithms with a single-loop assuming the length of the detection zone and vehicle.
(2) Advanced detector cards can measure classification using "vehicle signature".
(3) Speed and classification measurement by magnetic detectors requires two units.
(4) Passive infrared detectors with multi-detection-zone capability can measure speed.
$\checkmark$, Can provide the data type, $X$, cannot provide the data type
(Sources Road Traffic Data: Collection Methods and Applications)

Among various types of traffic count, for my study I have choose the manual count method in order to determine the number and movement of vehicle refer to the research paper by Ahmad Faiz Bin Nasir, 2012.

### 2.7 CONCLUSION

In this chapter, the discussion on the intersections studies, traffic flow characteristics at signalized intersection, traffic light at signalized intersection, capacity and level of service (LOS), traffic volume studies that also included the type of traffic count have been done. These all content were discussed based on the journal, article, books and research paper.

## CHAPTER 3

## METHODOLOGY

### 3.1 INTRODUCTION

In order to study the level of service of existing condition at the intersection, the analysis that need to be consider like amount and distribution of traffic movement, traffic composition and geometric characteristic and details of intersection signalization. (John, D.Z., Richard, D., James, B., 2000). The intersection study area is near to the SMK Seri Mahkota which is also the road to Jalan Sungai Panching Utara and Kuantan. The parameter that need to be collected such as geometric conditions, traffic conditions and signalization conditions. (John, D.Z., Richard, D., James, B., 2000).

### 3.2 DATA COLLECTION

In order to collect the data, the data collection will be recorded in several days during AM and PM peak hour on weekdays and weekend by manual count. The equipment used in data collection are paper, stopwatch and stationary. The paper and stationary is needed to record the number of vehicle manually from all direction within one hour during peak hour. The stopwatch is important in order to determine the 15 minutes time interval and to calculate the cycle time of green, amber and red. The data that need to be collect such as distribution of traffic flow and geometric characteristic.

Table 3.1 below shown the data that needed for each lane group. (John, D.Z., Richard, D., James, B., 2000).

Table 3.1: The data that needed for each lane group

| Type of |
| :--- | :--- |
| Condition | Parameter

Since all of the approach from Kuantan, Gambang and Panching have two movements, 6 person will assign in order to collect intersection geometric survey data. Figure 3.1 and 3.2 shows the intersection geometric from all approach from Google satellite.

Figure 3.1: Approach from Kuantan and Panching
(Sources Google Earth)

Figure 3.2: Approach from Gambang
(Sources Google Earth)

### 3.2.1 Traffic Volume Survey

Traffic volume survey is count manually at the study area during the peak hour morning and evening around 3 hours on working days to get the accurate data which is
within 7.00 to 10.00 in the morning and 4.00 to 7.00 in the evening refer to the research paper by Ahmad Faiz Bin Nasir, 2012. The large number of data may be recorded when conduct the manual counts therefore, the data forms should be carefully labeled and organized. On each tally sheet, should have the location, time and date of observation, and weather conditions. (Traffic Volume Counts, n.d.). Site characteristic of an intersection, traffic volume and vehicle classification based on Malaysian traffic characteristic should be considered in collecting the data. The vehicle classification is shown in Table 3.2. (Jamil, W.A., \& Ibrahim, W.H.W., 2013).

Table 3.2: Vehicle Classification (Arahan Teknik Jalan 8/86)

| Class | Vehicle Classification |
| :---: | :---: |
| 1 | Passenger cars, Taxi, Small vans \& Utilities (Light 2 Axles) |
| 2 | Lorry, large van(Heavy vehicle with 2-axles) |
| 3 | Lorry, large van (Heavy vehicles with 3 axles or more) |
| 4 | Buses |
| 5 | Motorcycles, Scooter |

(Sources An Analysis of Unsignalised Intersection Using aaSIDRA Software)

### 3.3 LOCATION SELECTION

T-Intersection of Jalan Kuantan - Gambang (Panching) has been chosen as a study area. It is significant intersection since this road form as a backbone of main road to Kuantan with higher traffic volume of long distance traffic generated form East Coast expressway and short distance traffic from local residents. Besides that, the traffic composition at this location is mixed as all type of vehicle such as public bus (RAPID KUANTAN) and school bus, light and heavy truck and cars from Kuala Lumpur and Johor used this road. The study area also near to the school which is contribute to the increasing traffic volume during peak hour morning and evening. In addition, this road also head to the Sungai Panching which is one of the recreation area in Pahang. Figure 3.3 below show the images of study area from satellite.

Figure 3.3: Images of study area from satellite

### 3.4 DATA ANALYZING

The data collection will be analyzed using MHCM 2006 that classify into observed model and proposed model. In order to analyze the data, the flow rate, saturation flow rate and capacity analysis which are included lost time, effective green time and green time ratio, lane capacity, control delay need to be determine. Lastly level of service (LOS) of intersection can be determine. (A Guide to the Design of Traffic Signals, 1987).

### 3.4.1 Determination of Flow Rate, Vp

The flow rate is derived from an hourly volume by dividing the movement volume by Peak Hour Factor (PHF) that computed by:

$$
\begin{equation*}
V p=\frac{V}{P H F} \tag{Eqn 3.1}
\end{equation*}
$$

### 3.4.2 Determination of Saturation Flow Rate, $S$

The ideal saturation flow rate for Malaysian road condition is 1930 passenger cars per hour of green.

$$
S=S_{o} \times N \times f_{w} \times f_{g} \times f_{a} \times f_{L T} \times f_{R T} \times\left(1 / f_{c}\right)
$$

Where

S = Saturation flow rate under prevailing conditions (vehicle per hour of effective green time)
$S_{o} \quad$ = Ideal saturation flow rate which is 1930 passenger cars per hour of green time per lane.
$\mathrm{N}=$ number of lanes in the lane group
$\mathrm{f}_{\mathrm{w}}=$ adjustment factor for lane width (3.66 meter is the standard lane width)
$\mathrm{f}_{\mathrm{g}} \quad=$ approach grade adjustment factor
$\mathrm{f}_{\mathrm{a}}=$ area type adjustment factor
$\mathrm{f}_{\mathrm{RT}}=$ right turning in the lane group adjustment factor
$\mathrm{f}_{\mathrm{LT}}=$ left turning in the lane group adjustment factor
$\mathrm{f}_{\mathrm{c}}=$ vehicle composition correction factor ( $\mathrm{f}_{\mathrm{car}}+\mathrm{f}_{\mathrm{HV}}+\mathrm{f}_{\text {motor }}$ )
$\mathrm{f}_{\mathrm{HV}}=$ adjustment factor for heavy vehicle (any vehicle having more than four tires touching the pavement)
$\mathrm{f}_{\text {car }}=$ adjustment factor for passenger cars
$\mathrm{f}_{\text {motor }}=$ adjustment factor for motorcycles

### 3.4.2.1 Lane Width Adjustment Factor, $f_{w}$

Lane width adjustment factor is obtained through the equation below:

$$
\begin{equation*}
f w=1+\frac{w-3.66}{3.663} \tag{Eqn 3.3}
\end{equation*}
$$

Where w is the average lane width

### 3.4.2.2 Grade Adjustment Factor, $\mathbf{f}_{\mathrm{g}}$

Grade adjustment factor is separated into uphill and downhill which is computed by:

Downhill gradient adjustment factor,

$$
\begin{equation*}
f g=1-\frac{G}{26.34} \tag{Eqn 3.4}
\end{equation*}
$$

Uphill gradient adjustment factor,

$$
\begin{equation*}
f g=1-\frac{G}{14.39} \tag{Eqn 3.5}
\end{equation*}
$$

Where G is the gradient in percentage
Note: These formulas are only applicable for gradient from $-5.24 \%$ to $3.49 \%$.

### 3.4.2.3 Area Type Adjustment Factor, fa

The corresponding area type adjustment factor for CBD and non CBD areas in Malaysia is 0.8454 and 1.0000 respectively. According to US HCM 2000, CBD or Central Business District can be described if the following condition is satisfied:
a) Narrow street right-way
b) Frequent parking maneuvers
c) Vehicle blockage
d) Taxi and bus activity
e) Small radius turns
f) Limited use of exclusive turn lanes
g) High pedestrian activity
h) Dense population
i) Mid-block curb cuts

Table 3.3: Adjustment Factor for Area Type, fa

| Type of area | Area type factor, fa |
| :---: | :---: |
| CBD | 0.8454 |
| NON CBD | 1.000 |

(Sources Arahan Teknik (Jalan) 13/87)

### 3.4.2.4 Left Turn Adjustment Factor, flt

Left Turn Adjustment Factor is computed based on to the formula shown in Table 3.4 below:

Table 3.4: Adjustment Factor for Left (f $\mathrm{f}_{\mathrm{LT}}$ )

| Case/Lane Type | Left Turn Adjustment Factor (f $\mathbf{f}_{\mathbf{L T}}$ ) |
| :---: | :---: |
| Exclusive | 0.76 |
| Shared | $1.0-0.243 \mathrm{P}_{\mathrm{LT}}$ |

Note: $\mathrm{P}_{\mathrm{LT}}=$ Proportion of left turn in lane group (Sources Arahan Teknik (Jalan) 13/87)

### 3.4.2.5 Right Turn Adjustment Factor, frt

Right turns also may be operated in either an exclusive or shared lane. Table 3.5 shows the adjustment factor for right turning at a signalized intersection.

Table 3.5: Adjustment Factor for Right ( $\mathrm{f}_{\mathrm{RT}}$ )

| Case/Lane Type | Right Turn Adjustment Factor (f $\left.\mathbf{f}_{\text {RT }}\right)$ |
| :---: | :---: |
| Exclusive | 0.84 |
| Shared | $1 / 1+0.195 \mathrm{P}_{\mathrm{RT}}$ |

Note: $\mathrm{P}_{\mathrm{Rt}}=$ Proportion of right turn in lane group

### 3.4.2.6 Vehicle Composition Correction Factor, $f_{c}$

The reflection of the composition of car, heavy vehicles and motorcycle at signalized intersection is analyzed from vehicle composition correction factor.

$$
\begin{array}{ll}
\mathrm{f}_{\mathrm{c}}=\mathrm{f}_{\text {car }}+\mathrm{f}_{\mathrm{HV}}+\mathrm{f}_{\text {motor }} & \text { Eqn 3.6 } \\
\mathrm{f}_{\mathrm{HV}}=\mathrm{f}_{\text {trailer }}+\mathrm{f}_{\text {bus }}+\mathrm{f}_{\text {lorry }} & \text { Eqn 3.7 }
\end{array}
$$

where fcar $=e_{c a r}\left(\frac{q \text { car }}{V}\right)$

$$
\begin{aligned}
& \mathrm{f}_{\mathrm{HV}}=e_{\text {motor }\left(\frac{q \text { motor }}{V}\right)} \\
& \mathrm{f}_{\text {trailer }}=e_{\text {trailer }\left(\frac{q \text { trailer }}{V}\right)} \\
& \mathrm{f}_{\text {bus }}=e_{\text {bus }\left(\frac{q \text { bus }}{V}\right)} \\
& \mathrm{f}_{\text {lorry }}=e_{\text {lorry }\left(\frac{q \text { lorry }}{V}\right)}
\end{aligned}
$$

The collection data will be convert to Passenger Car Unit (PCU) following to Arahan Teknik (Jalan) 13/87. Table 3.6 below show the conversion factor to PCU.

Table 3.6: Conversion factors to pcu's

| Vehicle Type | Passenger Car Equivalent (Pce) |
| :---: | :---: |
| Cars, $\mathrm{e}_{\text {car }}$ | 1.00 |
| Motorcycles, $\mathrm{e}_{\text {motor }}$ | 0.22 |
| Trailers, $\mathrm{e}_{\text {trailer }}$ | 2.27 |
| Buses, $\mathrm{e}_{\text {bus }}$ | 2.08 |
| Lorries, $\mathrm{e}_{\text {lorry }}$ | 1.19 |

(Sources Arahan Teknik (Jalan) 13/87)

$$
\begin{aligned}
& \text { qcar }=\text { Total number of cars observed } \\
& \text { qtrailer }=\text { Total number of trailer observed } \\
& \text { qbus } \quad \text { = Total number of bus observed }
\end{aligned}
$$

qlorry $=$ Total number of lorry observed
qmotor $=$ Total number of motor observed
$\mathrm{V} \quad=$ Total vehicle flow per hour

### 3.4.3 Capacity Analysis

The calculation of capacity is included the calculations of Lost time, Effective Green Time and Green Time Ratio.

### 3.4.4 Determination of Lost time, $t_{L}(S)$

Lost time is calculated by:

$$
\mathrm{t}_{\mathrm{L}}(\mathrm{~s})=11+\mathrm{Y}-\mathrm{e}
$$

Eqn 3.8

$$
\begin{aligned}
& \mathrm{I} 1=\text { start loss }(\mathrm{s}) \\
& \mathrm{Y}=\text { Intergreen }(\mathrm{s})=\text { Amber }+ \text { all red } \\
& \mathrm{e}=\text { end gain }(\mathrm{s})
\end{aligned}
$$

### 3.4.5 Determination of Effective Green time, $\mathbf{g}$ (s)

The formula for green time is:

$$
\begin{equation*}
G=G+Y-t_{L} \tag{Eqn 3.9}
\end{equation*}
$$

$\mathrm{G}=$ Actual green time
$\mathrm{Y}=$ Amber + all red time
$\mathrm{t}_{\mathrm{L}}=$ Lost time

### 3.4.6 Determination of Green Ratio, g/C

$$
\begin{equation*}
\text { Green Ratio }=\mathrm{g} / \mathrm{C} \tag{Eqn 3.10}
\end{equation*}
$$

$\mathrm{g}=$ Effective green time
$\mathrm{C}=$ Cycle length

### 3.4.7 Determination of Lane Capacity, c (veh/hr)

$$
\begin{equation*}
\mathrm{C}(\mathrm{veh} / \mathrm{hr})=\mathrm{S}(\mathrm{~g} / \mathrm{C}) \tag{Eqn 3.11}
\end{equation*}
$$

$\mathrm{S}=$ saturation flow rate (veh/hr)
$\mathrm{G}=$ Effective green time
C = Cycle length

### 3.4.8 Determination of Degree of Saturation, $X$ ( $\mathrm{V} p / \mathrm{c}$ ratio)

$$
\begin{equation*}
\mathrm{X}=\mathrm{Vp} / \mathrm{c} \tag{Eqn 3.12}
\end{equation*}
$$

$\mathrm{X}=$ Degree of Saturation
$\mathrm{Vp}=$ Adjusted flow rate (veh/hr)
c = Lane capacity (veh/hr)

### 3.4.9 Determination of Flow Ratio, $\mathbf{y}$

$$
\text { Flow ratio, } \mathrm{y}=\mathrm{Vp} / \mathrm{S}
$$

Eqn 3.13
y = ratio of flow to saturation flow
$\mathrm{Vp}=$ Adjusted flow rate in veh/hr
S = Saturation flow rate in veh/hr

The y value for a phase is the highest y value from the approaches within that phase. For the whole junction,

$$
\begin{equation*}
y=\sum_{i=1}^{n} y i \tag{Eqn 3.14}
\end{equation*}
$$

Where $\mathrm{n}=$ number of phase
yi $=$ highest y value from the approach within that phase i.

The $y$ value should be not higher than 0.65 . If the value is higher than 0.85 , it is recommended that the geometrics of the intersection be upgraded to increases the capacity.

### 3.4.10 Determination of Level of Service (LOS)

The calculation of Level of Service is based on Intersection Delay which is a combination of Uniform Control Delay. Incremental Delay and Initial Queue Delay. Table 3.7 below used to determine the LOS at signalized intersection.

Table 3.7: Level of Service for Signalized Intersection

| LEVEL OF SERVICE | CONTROL DELAY PER VEHICLE (SEC) |
| :---: | :---: |
| A | $<=10.0$ |
| B | $>10.0$ to 20.0 |
| C | $>20.0$ to 35.0 |
| D | $>35.0$ to 55.0 |
| E | $>55.0$ to 80.0 |
| F | $>80.0$ |

(Sources Arahan Teknik Jalan 13/87)

### 3.4.11 Determination of Delay, d

Average control delay is estimated for each lane group in the LOS table. The average control delay per vehicle for a given lane group is given below.

$$
\begin{equation*}
\mathrm{d}=\mathrm{d}_{1} \mathrm{PF}+\mathrm{d}_{2}+\mathrm{d}_{3} \tag{Eqn 3.15}
\end{equation*}
$$

where: $\mathrm{d}=$ control delay ( $\mathrm{sec} / \mathrm{veh}$ )
$\mathrm{d} 1=$ uniform control delay (sec/veh)
d2 $=$ incremental delay ( $\mathrm{sec} / \mathrm{veh}$ )
d3 = initial queue delay
$\mathrm{PF}=$ uniform delay progression adjustment factor which accounts for effect of signal progression
$\mathrm{X}=\mathrm{v} / \mathrm{c}$ ratio for lane group
$\mathrm{C}=$ cycle length (sec)
$\mathrm{c}=$ capacity of lane group (vph)
$\mathrm{g}=$ effective green time for lane group (sec)
$\mathrm{T}=$ duration of analysis period
$\mathrm{k}=$ incremental delay factor that is dependent on controller settings
1 = upstream filtering/ metering adjustment factor

### 3.4.11.1 Uniform Control Delay, d1

The equation for calculated delay is given below:

$$
\begin{equation*}
d 1=\frac{0.5 C\left(1-\frac{g}{c}\right)^{2}}{1-\left[\min (1, X) \frac{g}{c}\right]} \tag{Eqn 3.16}
\end{equation*}
$$

Where $\mathrm{X}=\mathrm{v} / \mathrm{c}$ ratio for lane group; if the value of X exceeds 1 , then a value of 1 should be used instead of the value of $X$
$\mathrm{C}=$ cycle length ( sec )
$\mathrm{g}=$ effective green time for lane group (sec)

### 3.4.11.2 Progression Adjustment Factor, PF

Progression Adjustment Factor, $\mathrm{PF}=\frac{(1-P) f p}{1-\left(\frac{g}{c}\right)}$
Eqn 3.17

Where $\mathrm{P}=$ proportion of vehicle arriving on the green
$\frac{g}{c}=$ proportion of available green time
$\mathrm{fp}=$ supplemental adjustment factor for when the platoon arrives during green

The default values for $\mathrm{fp}, \mathrm{g} / \mathrm{c}$ ratio and Arrival Type factor are shown in Table 3.8.

Table 3.8: Progression Adjustment Factor

| Green Ratio | Arrival Type (AT) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(\mathrm{g} / \mathrm{c})$ | AT-1 | AT-2 | AT-3 | AT-4 | AT-5 | AT-6 |
| 0.20 | 1.167 | 1.007 | 1.000 | 1.000 | 0.833 | 0.750 |
| 0.30 | 1.286 | 1.063 | 1.000 | 0.986 | 0.714 | 0.571 |
| 0.40 | 1.445 | 1.136 | 1.000 | 0.895 | 0.555 | 0.333 |
| 0.50 | 1.667 | 1.240 | 1.000 | 0.767 | 0.333 | 0.000 |
| 0.60 | 2.001 | 1.395 | 1.000 | 0.576 | 0.000 | 0.000 |
| 0.70 | 2.556 | 1.653 | 1.000 | 0.256 | 0.000 | 0.000 |
| Default, fp | 1.00 | 0.93 | 1.00 | 1.15 | 1.00 | 1.00 |
| Default, Rp | 0.333 | 0.667 | 1 | 1.333 | 1.667 | 2 |

Note: 1 - Tabulation based on default values of fp and Rp
$2-\mathrm{P}=\mathrm{Rp} \mathrm{g} / \mathrm{c}$ may not exceed 1.0
3 - PF may not evceed 1.0 for AT-3 through AT-6
(Sources Arahan Teknik Jalan 13/87)

The value of P can be measured at the site or estimated from the arrival type that are consist of 6 types shown below:
i. Arrival Type 1 (AT-1)

Dense platoon, which is contain over 80 percent of the lane group volume that arrive at the start of the red phase.
ii. Arrival Type 2 (AT-2)

Moderately dense platoon arriving in the middle of the red phase that contains 40 to 80 percent of the lane group volume.
iii. Arrival Type 3 (AT-3)

Random arrivals in which the main platoon contains less than 40 percent of the lane group volume. This AT is representative of operations at isolated and noninterconnected signalized intersection characterized by highly dispersed platoons.
iv. Arrival Type 4 (AT-4)

Moderately dense platoon that arrive in the middle of the green phase which is contains 40 to 80 percent of the lane group volume.
v. Arrival Type 5 (AT-5)

Dense to moderately dense platoon that contains over 80 percent of the lane group volume which are arrive at the start of the green phase.
vi. Arrival Type 6 (AT-6)

This arrival represent very dense platoons progressing over a number of closely spaced intersections with minimal side street entries.

### 3.4.11.3 Incremental Delay, d2

Equation below describe the delay based on non-uniform arrivals and individual cycle failures. It is invalid if the value of X exceeds $1 / \mathrm{PHF}$ because the hourly volume exceeds the hourly capacity.

$$
\begin{equation*}
\mathrm{d} 2=900 \mathrm{~T}\{(\mathrm{X}-1)+\sqrt{[(X-1) 2+8 k l X / c T]} \tag{Eqn 3.18}
\end{equation*}
$$

where
$\mathrm{T}=$ duration of analysis period
$\mathrm{k}=$ incremental delay factor that is dependent on controller settings
1 = upstream filtering/ metering adjustment factor
$\mathrm{X}=\mathrm{v} / \mathrm{c}$ ratio for lane group
$\mathrm{c}=$ capacity of lane group ( vph )

### 3.4.11.4 Incremental Delay Calibration factor, $k$

For pre-timed signal, $\mathrm{k}=0.50$ which is based on a queuing process with random arrivals. The actuated controller can reduce incremental delay as it can modify the green time due to the traffic demand.

### 3.4.11.5 Initial Queue Delay, $d_{3}$

The equation for initial queue delay is shown below.

$$
\begin{equation*}
d 3=\frac{1800 Q b(1+u) t}{c T} \tag{Eqn 3.19}
\end{equation*}
$$

Where:
$\mathrm{Q}_{\mathrm{b}}=$ initial queue at the start of period T (veh)
$\mathrm{c}=$ adjusted lane group capacity (veh/hr)
$\mathrm{T}=$ analysis period (hr)
$\mathrm{t}=$ duration of unmet demand in $\mathrm{T}(\mathrm{hr})$
u = delay parameter
$\mathrm{d}_{3}$ can be assumed ad 0 if residual queue is negligible.

### 3.4.11.6 Approach Delay, $d_{A}$

The equation below used to compute the approach delay.

$$
\begin{equation*}
\text { Approach Delay, } \mathrm{d}_{\mathrm{A}}=\frac{\sum d i v i}{\sum v i} \tag{Eqn 3.20}
\end{equation*}
$$

Where:
$\mathrm{d}_{\mathrm{A}}=$ delay for approach A ( $\mathrm{sec} / \mathrm{veh}$ )
$\mathrm{d}_{\mathrm{i}}=$ delay for lane group I (on approach A) (sec.veh)
$\mathrm{v}_{\mathrm{i}}=$ adjusted flow for lane group I (veh/hr)
After all of the approach delay are determined, the intersection can be calculated using the equation below.

Where:
$\mathrm{d}_{\mathrm{i}}=$ average delay per vehicle for the intersection I (sec/veh)
$\mathrm{v}_{\mathrm{A}}=$ adjusted flow for approach $\mathrm{A}(\mathrm{veh} / \mathrm{hr})$

Lastly, the level of service (LOS) for intersection can be determine according to the intersection delay, $\mathrm{d}_{\mathrm{I}}$ value against the delay segment tabulated in Table 3.7. Table 3.9, 3.10 and 3.11 below shown the worksheet from MHCM 2006 that used to analyze the data obtained.

Table 3.9: Input Worksheet

Table 3.10: Volume Adjustment and Saturation Flow Rate Worksheet

Table 3.11: Capacity and Los Worksheet

### 3.5 CONCLUSION

In this chapter, the data collection which are including the method, equipment and all parameter were discussed. Besides that, location selection also were highlighted in this chapter. Lastly, this chapter also discusses on how to analyze the data collection. All the result for data collection will be discuss on next chapter.

## CHAPTER 4

## ANALYSIS AND DISCUSSION

### 4.1 INTRODUCTION

In this chapter, analysis and results of the level of service for observed and proposed condition at the intersection will be discussed. In order to carry out this project, the data collection need to be done such as distribution of traffic flow and geometric characteristic during AM and PM peak hours. All the data will be used to figure out the delay and level of service for each lane at the signalized intersection which the evaluation of the performance of this signalized intersection will be done. All the results will be present in this chapter meanwhile more specific data collection will be present in the Appendices.

### 4.2 TRAFFIC FLOW DATA

Traffic flow data was collected manually at the study area during AM and PM peak hour weekdays and weekend. The data collection have been done within 7.00 to 8.00 A.M in the morning during weekdays and 8.00 to 9.00 A.M in the morning during weekend. Meanwhile, the data collection for PM peak was collected within 5.00 to 6.00 P.M in the evening for both weekdays and weekend. The data was taken in 15 minutes time interval and classified based on the vehicle classification in Malaysian traffic characteristic. According to the pilot study that have been done for a week within 3 hours in the morning and evening, traffic volume data for Wednesday and Saturday have been selected to be analyzed. Traffic volume data for Wednesday is the highest data compared to other weekdays while data collection for Saturday was higher than Sunday. In addition, only the peak hour data for morning and evening will be analyzed due to the critical condition at the intersection. The peak hour for morning on weekdays was 7.00 to 8.00 A.M meanwhile for weekend was 8.00 to 9.00 A.M in the morning. While the peak hour
for the evening on weekdays and weekend was similar which are 5.00 to $6.00 \mathrm{P} . \mathrm{M}$ in the evening. These data were shown in Table 4.1 for each approach in the AM peak on weekdays and weekend meanwhile Table 4.2 present the data for each approach in the PM peak on the weekdays and weekend.

Table 4.1: Traffic Volume for AM Peak

| Time | Total Volume (Veh/hr) from North |  | Total Volume (Veh/hr) from South |  | Total Volume (Veh/hr) from West |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Weekdays |  |  |  |  |  |
|  | NS | NW | SN | SW | WN | WS |
| 7.00-7.15 am | 302 | 159 | 406 | 321 | 119 | 109 |
| 7.15-7.30 am | 388 | 133 | 469 | 162 | 160 | 127 |
| 7.30-7.45 am | 525 | 119 | 452 | 97 | 126 | 82 |
| 7.45-8.00 am | 352 | 177 | 416 | 60 | 100 | 57 |
| Total | 1567 | 588 | 1743 | 640 | 505 | 375 |
|  | Weekend |  |  |  |  |  |
|  | NS | NW | SN | SW | WN | WS |
| 8.00-8.15 am | 287 | 61 | 307 | 42 | 75 | 61 |
| 8.15-8.30 am | 337 | 63 | 302 | 51 | 106 | 28 |
| 8.30-8.45 am | 350 | 63 | 309 | 41 | 99 | 52 |
| 8.45-9.00 am | 340 | 66 | 258 | 50 | 84 | 33 |
| Total | 1314 | 253 | 1176 | 184 | 364 | 174 |

According to the data shown in the Table 4.1, total volume (veh/hr) during weekdays morning from all approach were higher than total volume (veh/hr) during weekend morning. The total volume from north to south for weekdays morning at 7.00 to 8.00 A.M is $1567 \mathrm{veh} / \mathrm{hr}$ however for the weekend morning the volume only $1314 \mathrm{veh} / \mathrm{hr}$ which is at 8.00 to 9.00 A.M. This occur due to the activities on this road for the weekdays morning is higher than weekend. Mostly the people who live at Kuantan used this road to go work at Gambang on weekdays at 7.00 to 8.00 A.M that contribute to the higher traffic volume. Besides that, the traffic volume on weekdays morning from north to west also higher compared to the weekend which is $588 \mathrm{veh} / \mathrm{hr}$ because of the people who want send their children to the SMK Seri Mahkota.

Other than that, total traffic volume from south to north on weekdays which is $1743 \mathrm{veh} / \mathrm{hr}$ is also higher than weekend due to the people who live in the Gambang go to work at Kuantan at 7.00 to 8.00 A.M in the morning. Then, the total traffic volume from south to west on weekdays also high which is $640 \mathrm{veh} / \mathrm{hr}$ as the student want go to the school. In addition, the Kem Tentera Batu Sepuluh Kuantan also located near to this site study which is contribute to the high total traffic volume on this approach.

Besides that, the total traffic volume from west to north is higher than total traffic volume from west to south whether on weekdays or weekend. This occur due to the mostly people have their own affair at the Kuantan City as Kuantan is the state capital of Pahang. Other than that, there are a few of parents that already send their children to the school and want to back home or work used again this approach that also contribute to the high activities at this approach. Figure 4.1 shows weekdays peak hour volume (AM) meanwhile Figure 4.2 shows weekend peak hour volume (AM).

Figure 4.1: Weekdays Peak Hour Volume (AM)

Figure 4.2: Weekend Peak Hour Volume (AM)

Based on the Figure 4.1 and Figure 4.2, weekdays peak hour volume (AM) was worst compare to the weekend. These happened due to the more activities on road on weekdays such as people went to work, school, supplies goods to the shop and others. Nevertheless on weekend, people more like to stay and rest at their home in the morning since on the weekdays they need to go out for work early in the morning. Then, the data for each approach in the PM peak on weekdays and weekend were tabulated in Table 4.2.

Table 4.2: Traffic Volume for PM Peak

| Time | Total Volume (Veh/hr) from North |  | Total Volume (Veh/hr) from South |  | Total Volume (Veh/hr) from West |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |
|  | NS | NW | SN | SW | WN | WS |
| 5.00-5.15 pm | 439 | 92 | 458 | 48 | 99 | 74 |
| 5.15-5.30 pm | 413 | 98 | 499 | 56 | 100 | 65 |
| 5.30-5.45 pm | 450 | 123 | 494 | 76 | 120 | 74 |
| 5.45-6.00 pm | 485 | 122 | 473 | 67 | 115 | 49 |
| Total | 1787 | 435 | 1924 | 247 | 434 | 262 |
|  | Weekend |  |  |  |  |  |
|  | NS | NW | SN | SW | WN | WS |
| 5.00-5.15 pm | 429 | 71 | 515 | 40 | 75 | 18 |

| $\mathbf{5 . 1 5 - 5 . 3 0} \mathbf{~ p m}$ | 468 | 91 | 486 | 39 | 88 | 25 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{5 . 3 0 - 5 . 4 5} \mathbf{~ p m}$ | 449 | 78 | 586 | 43 | 93 | 22 |
| 5.45-6.00 pm | 463 | 69 | 552 | 34 | 101 | 20 |
| Total | 1809 | 309 | 2139 | 156 | 357 | 85 |

Table 4.2 above demonstrated that PM peak hour is similarly between weekdays and weekend which is at 5.00 to 6.00 P.M since during weekdays, mostly people back from work around that time. In contrast of the traffic volume for AM peak from north to south and south to north, the traffic volume for PM peak from both approach on weekend worse compared to weekdays. During weekend, the activities on the road in the evening was higher as the people go out for shopping, hang out with family and friends and also go out to do their hobbies such as hiking, fishing, travelling and others since during weekdays they already reached home in the evening. So they does not have time to spend with their family. Mostly the people would like go to the Kuantan city as in Kuantan, they can watch movie on cinema at East Coast Mall (ECM) and Berjaya Megamall, shopping, go to the Teluk Cempedak to see the beach and others. These will contribute to the increasing of the number of vehicle during that time.

Besides that, traffic volume for south to west during weekdays is higher than weekend since there are two school located at this area so usually student back from school on this time because of the event in their school. Then, the traffic volume for PM peak from west to north and west to south during weekdays are higher than on weekend. This might be due to the people who work at Panching were back from work to the Kuantan City and Gambang. Figure 4.3 shows weekdays peak hour volume (PM) meanwhile Figure 4.4 shows weekend peak hour volume (PM).

Figure 4.3: Weekdays Peak Hour Volume (PM)

Based on the Figure 4.3 above shows that traffic volume for south to north is higher than north to south because of the people from residential area in Kuantan was back home from Gambang. The total traffic volume at this area keep increasing year by year since every year the resident at this area increase. One of that is resident from Kem Tentera Batu Sepuluh Kuantan. Besides that, at the Gambang also have new housing development that also contribute the number of traffic volume keep increasing as well as the number of resident increase.

Figure 4.4: Weekend Peak Hour Volume (PM)

Based on the Figure 4.3 and Figure 4.4, peak hour volume during weekend (PM) more worst compared to the weekdays. These occur due to the on weekend the people like to going out with their family and friends in order to release stress. Other than that, a lot of people will travelling and going back to their hometown during weekend. Thus, the total volume during evening on weekend will increasing as there are a lot of activities on the road.

### 4.3 SIGNAL PHASING

A signal phase is define as the right-of-way, yellow change, and red clearance intervals in a cycle that are assigned to an independent traffic movement or combination of traffic movements by the Manual on Uniform Traffic Control Devices (MUTCD). (Signalized Intersections: Informational Guide, 2004). According to the Traffic Engineering and Management, a phase is the green interval plus the change and clearance intervals that follow it. Therefore, each phase was not assigned with the non-conflicting movements during the green interval. Besides that, the phase also allows a set of movements to flow safely before another set of movements of phase started. The phase was designed in order to make sure there are no conflict of the movement in an intersections. (Mathew, T.M., 2014). However, the minimum number of phase used will minimize the amount of lost time due to starting delays and clearance intervals.

The length of the phase should be not so long and properly design in order to avoid wasting the green time and delays occur on another approach. Since the proper design of phase length will efficiently balance the cycle time available among the several phases. (MnDOT Traffic Signal Timing and Coordination Manual, 2013). The intersection of this study have 3 phases which the phase 1 is from Gambang (South), phase 2 is from Kuantan (North) and phase 3 is from Panching (West). All phases were shown in the Table 4.3.

Table 4.3: All phases for this intersection

| Phase 1 | Phase 2 | Phase 3 |
| :---: | :---: | :---: |
| North | North | North |
|  |  | $\xrightarrow[4]{4}$ |
| $77^{44}$ |  |  |
| Weekdays | Weekdays | Weekdays |
| AM Peak PM Peak | AM Peak PM Peak | AM Peak PM Peak |
| $\mathrm{G}=117 \mathrm{~s} \quad \mathrm{G}=120 \mathrm{~s}$ | $\mathrm{G}=74 \mathrm{~s} \quad \mathrm{G}=78 \mathrm{~s}$ | $\mathrm{G}=45 \mathrm{~s} \quad \mathrm{G}=25 \mathrm{~s}$ |
| $\mathrm{I}=4 \mathrm{~s} \quad \mathrm{I}=4 \mathrm{~s}$ | $\mathrm{I}=4 \mathrm{~s} \quad \mathrm{I}=4 \mathrm{~s}$ | $\mathrm{I}=4 \mathrm{~s} \quad \mathrm{I}=4 \mathrm{~s}$ |
| Weekend | Weekend | Weekend |
| AM Peak PM Peak | AM Peak PM Peak | AM Peak PM Peak |
| $\mathrm{G}=84 \mathrm{~s} \quad \mathrm{G}=82 \mathrm{~s}$ | $\mathrm{G}=35 \mathrm{~s} \quad \mathrm{G}=59 \mathrm{~s}$ | $\mathrm{G}=32 \mathrm{~s} \quad \mathrm{G}=17 \mathrm{~s}$ |
| $\mathrm{I}=4 \mathrm{~s} \quad \mathrm{I}=4 \mathrm{~s}$ | $\mathrm{I}=4 \mathrm{~s} \quad \mathrm{I}=4 \mathrm{~s}$ | $\mathrm{I}=4 \mathrm{~s} \quad \mathrm{I}=4 \mathrm{~s}$ |

In phase 1, the vehicle from south will move while from another critical lane approach will stopped. Then, the vehicle from north will move in phase 2 and the critical lane from another approach will stopped. Lastly, the vehicle from west will move in phase 3 while other vehicle in another approach stopped.

### 4.4 DELAY AND LEVEL OF SERVICE (LOS) BY APPROACH

Delay is defined as the elapsed time starting when a vehicle stops at the end of a queue until the vehicle departs at the stop line. This delay is determine based on the flow rate for each approach that is directly proportional to the distribution of vehicles among the approaches. The delay will includes the time needed for the vehicle to move from the end of the queue position to the first-in-queue position and deceleration of vehicles from free-flow speed to the speed of vehicles in the queue. (Level of Service Definitions, n.d.). The Level of Service is determine by approaching each three direction at T- Intersection at the study area. The worst level of service (LOS) in the approach will affect the level of service for whole intersections.

Figure 4.5: Observed condition of delay and LOS by approach during weekdays (AM and PM peak)

All the approach of the intersection during weekdays (AM and PM peak) have level of service F. LOS F means the vehicle arrival rate is greater than the capacity of the intersection. The most critical lane is from West which have the longer delay of $100.50 \mathrm{sec} / \mathrm{veh}$ and $104.00 \mathrm{sec} / \mathrm{veh}$. The traffic more congested in the AM peak compared to PM peak since during the weekdays the community were going out to work, school and also because of the transportation of goods.

Figure 4.6: Observed condition of delay and LOS by approach during weekend (AM and PM peak)

The traffic volume for weekend more congested during PM peak as the control delay per vehicle for PM peak was higher than AM peak. The community usually spend time hang out with their family and friends during the weekend (evening) compared to morning as in the morning they would like to stay and rest at home. The longer delay during weekend (AM and PM peak) is also from West which are $77.03 \mathrm{sec} / \mathrm{veh}$ and $82.25 \mathrm{sec} / \mathrm{veh}$. The level of service for both delay is also F. It shows that the West approach is in worst condition.

Figure 4.7: Proposed condition of delay and level of service by approach during weekdays (AM and PM peak)

After analysed the existing level of service, the proposed solution is by adding lane at West and South approach. The estimated delay by approach from South both AM and PM peak during weekdays have been improved by $51.61 \mathrm{sec} / \mathrm{veh}$ and $48.67 \mathrm{sec} / \mathrm{veh}$ from $86.46 \mathrm{sec} / \mathrm{veh}$ and $78.77 \mathrm{sec} / \mathrm{veh}$ which the LOS were improved from F to D which give better condition for this intersections.

Figure 4.8: Proposed condition of delay and level of service by approach during weekend (AM and PM peak)

The control delay per vehicle for West approach during weekend (AM and PM peak) also improved from $77.03 \mathrm{sec} / \mathrm{veh}$ to $56.7 \mathrm{osec} / \mathrm{veh}$ and $82.25 \mathrm{sec} / \mathrm{veh}$ to $70.61 \mathrm{sec} / \mathrm{veh}$. Then for the delay approach from South both AM and PM peak also have improvement from $33.85 \mathrm{sec} / \mathrm{hour}$ to $25.20 \mathrm{sec} / \mathrm{veh}$ and $65.54 \mathrm{sec} / \mathrm{veh}$ to $61.40 \mathrm{sec} / \mathrm{veh}$. Meanwhile the level of service of all approach during weekend (AM and PM peak) remain.

### 4.5 LEVEL OF SERVICE (LOS) INTERSECTION

Level of service is defined as "a quality measure describing operational conditions within a traffic stream, generally in terms of service measures such as speed and travel time, freedom to maneuver, traffic interruptions, comfort and convenience."(John, D.Z., Richard, D., James, B., 2000). The existing level of service for whole intersection during weekdays (AM and PM peak were F meanwhile the existing level of service for intersection during weekend (AM and PM peak) were D and E. According to the Arahan Teknik Jalan 13/87, the level of service for the intersection at the urban which are arterial and collector road should be D. The control delay for LOS D should be between 35 $\mathrm{sec} / \mathrm{veh}$ to $55.0 \mathrm{sec} / \mathrm{veh} .88 .66 \mathrm{sec} / \mathrm{veh}$ and $82.99 \mathrm{sec} / \mathrm{veh}$ were far away from the standard that shows the condition at this intersection is very bad. In these case, the level of service
for existing condition shows that the traffic light have the problem since this traffic light not follow the standard in Arahan Teknik Jalan 13/87. The traffic volume is very high at this area and the traffic light cannot support the increasing of the traffic volume caused the delay also increase.

In order to improve the situation, there are a lot of ways to do such as added lane, increase the green time and added the lane width. For this problem, the improvement that have been done was added one lane for Jalan Gambang to Kuantan (Thru Lane) and one lane for Jalan Panching to Gambang. Other than that the green time and cycle length also be changed. Table 4.4 represented the observed and proposed condition for AM peak meanwhile Table 4.5 tabulated the observed and proposed condition for PM peak.
4.6 OBSERVED AND PROPOSED CONDITION

Table 4.4: Observed and Proposed Condition for AM Peak

|  | OBSERVED (EXISTING) |  |  |  |  |  | PROPOSED (MODELLED) |  |  |  |  |  |

| LOS INTERSECTION |  | F |  |  | E |  |  | E |  |  | E |  |

### 4.7 CONCLUSION

In this chapter, the result and analysis for all the collected data were discussed. All the result were present into the table and figure. Besides that, the suggestion to improve the level of service of this intersection also be discussed in this chapter. The recommendation for this intersection will discussed in the next chapter.

## CHAPTER 5

## CONCLUSION AND RECOMMENDATION

### 5.1 INTRODUCTION

This study was carried out to evaluate the performance of a signalized intersections based on the level of the service (LOS) at the intersection. The study location of the T- signalized intersection is located at Batu 10, Jalan Gambang which is the major road to the Kuantan and near to the SMK Seri Mahkota. Since the traffic volume increasing by year due to the increasing population predicted by National Statistic Department Malaysia, this location was congested which is occur due to the setting of signalized intersection that not suit with the volume. Most of the traffic get stuck and cannot proceed the driving.

### 5.2 CONCLUSION

As for the conclusion, this study was successfully conducted and achieving the objectives which are to determine the existing level of service (LOS) of the signalized intersection during AM and PM peak hour and propose possible mitigation measures in order improve the future operating level of service (LOS). Based on the analyses, the existing level of the services (LOS) for this intersection shows that the condition of the intersection was very worst since the level of service during weekdays and weekend were F and D . The performance of this intersection during weekdays was worst compared to the weekend due to the high traffic volume. This might be because of high activities of transportation of goods, the people going out and back from work and the student going out and back from school. In addition, this road is a backbone of main road to Kuantan with higher traffic volume of long distance traffic generated form East Coast expressway and short distance traffic from local residents which cause the high activities at this
intersections. Therefore, the intersection need some improvement such as adjust or redetermine the suitable cycle length and make some change in the geometrical design such as added the number of lane, increase the width of the lane and others. After adding lanes, the level of service have been improve but for more efficient in the future, the flyover also can be proposed.

### 5.3 RECOMMENDATION

The output from MHCM 2006 table shows the performance during morning and evening session. According to the analyses, the condition of T-intersection very worst since the level of the service of the whole T -intersection during the weekdays and weekend not followed the standard of the level of service that stated in the Arahan Teknik Jalan 13/87. Hence, some recommendation need to be consider in order to improve the future operating level of service (LOS) at this intersection. There are some recommendation for this intersection which are adjust or re-determine the suitable cycle length, change the geometrical design such as added the number of lanes, and increase the width of the lane, installed the countdown timer to reduce the lost time and design the flyover.
