ACKNOWLEDGEMENTS

I would like to take this opportunity to acknowledge and express my gratitude to those who support me throughout this project.

First of all, I would like to express the deepest appreciation to my supervisor, Dr. Liew Siau Chuin who continuously support and guide me in every possible way to make this work possible.

Next, I would like to express my sincerest appreciation to my family and friends who always help and support me. Their suggestion, assistance and support from all ways are valuable to me. Their helping hand help me to complete the project work.

ABSTRAK

Pada masa kini, merancang satu aktiviti bukan satu tugas yang mudah kerana ia memerlukan penyelarasan daripada semua orang yang terlibat dalam aktiviti sama ada untuk perancangan aktiviti ataupun pelaksanaan aktiviti. Kesibukan orang pada masa kini dan jarak antara satu sama lain telah menjadi factor penyumbang utama kepada perbincangan yang buruk terutamanya semasa penyampaian maklumat aktiviti. Projek ini bermatlamat mengkaji aplikasi perancangan akitiviti yang sedia ada dan menghasilkan satu aplikasi perancangan aktiviti. Metodologi Pembanguna Aplikasi Rapid (RAD) telah digunakan dengan bahasa pengaturcaraan iaitu Java. Android Studio telah digunakan untuk membangunkan aplikasi yang dicadangkan. Aplikasi yang dibangunkan ini berjaya dibangunkan dengan fungsi asas apliksi perancangan akitiviti bagi pengurusan aktiviti dan beberapa fungsi khas untuk memudahkan perancangan aktiviti, penjadualan, dan komunikasi antara orang-orang seperti nota, dialog perbualan, peringatan, notifikasi dan lain-lain. Semua fungsi ini membantu pengguna untuk mengadakan komunikasi yang baik, mempunyai pemahaman yang lebih baik mengenai aktiviti dan mengurangkan risiko tertinggal apa-apa maklumat mengenai aktiviti. Aplikasi ini boleh dipertingkatkan lagi dengan membangunkan aplikasi ini dalam platform lain dan membolehkan aplikasi tersebut digunakan walaupun tiada internet.

ABSTRACT

Nowadays, organizing an event is not an easy task as it needs alignment with everyone involved from planning till the event implementation. Also, hustle and bustle life of people nowadays and geographical distance have become main factors that contribute to poor communication on event especially during information passes down. This project studies on existing event organizer applications and develop a mobile application platform for event organizing. Rapid Application Development (RAD) methodology is being used in this project with Java programming language and code development in Android Studio environment. This developed application successfully integrated basic event organizer functions for event management and some special functions to ease the event planning, scheduling, and communication between people such as event note, chat, reminder, push notification and etc. All these functions help user to establish proper communication, have better understanding about event and reduce the risk of missing any information about event. This application can be further improved by developing in vary mobile platform and allow user to access it during offline mode in the future.

CHAPTER 1

INTRODUCTION

1.1 Project Background

Nowadays, people like to have event or gathering with friends especially teenagers and adults. These event or gathering can be a high tea, birthday party or even a trip. Other than gathering with friends, people may have family gathering once a month or even once a week that may not only involve family but also relatives. In order to held a successful gathering or event, it is important to organize the event before the actual date. Starting from creating the event, many processes and criteria have to be taken into consideration such as inviting people, making certain decisions which are regarding venue, date, time and so on. It is not surprise to find out that some people cannot organize these gatherings effectively due to geographical distance and busy with their works which then result in poor event organize or events failure.

Due to certain factors that may affect the forming of events. Thus, mobile phone becomes the most convenient media to connect people. In 2016, an estimated 62.9% of the population worldwide already owned a mobile phone. By 2014, around 38% of all mobile users were smartphone users. By 2018, this number is expected to reach over 50% (The Statistics Portal, 2018). Since the smartphone user is growing rapidly, mobile application become a potential and huge market for businesses. Various kind of mobile applications are being launched in order to simplifier human daily tasks. Mobile application becomes one of the primary human needs.

Therefore, a mobile application that provides event organize features is being proposed. User is able to create events easily and organize them well. This is going to help user who like to have events or gathering in more efficient way.

1.2 Problem Statement

To organize events or gatherings is not an easy task for people. Each organizer has to go through certain process such as who and how should be invited, where and when should the event being held. The host has to confirm the details of event such as date, time and venue with every people involved. It can be said that organizing an event is a time consuming task. Some events or gatherings cannot be settled by one face-to-face meet up such as trip, birthday party and so on. Since people now are busy with their work and daily stuffs, they cannot attend to the discussions every time. As a result, some people cannot propose their ideas and follow up every details of the events process. Thus, the events may not go as well as every people hope it will be.

Besides, people nowadays may not able to have a discussion face-to-face due to geographical distance especially for adult who commit to work. They may stay far away from each other which causes them unable to have actual communication for the events that are going to be held. As a result, the events would not go as smooth as it should be.

Most of the event organizer applications in the market are developed for company or professionals that involved in big and formal events such as conference, meetings, festivals and so on. For example, Whova. They are not suitable for informal and small events such as gatherings, birthday party or even trip with friends and family.

1.3 Objectives

The objectives of this project are:

- i. To compare existing event organizer application.
- ii. To develop an event organizer mobile application.
- iii. To evaluate the proposed mobile application.

1.4 Scope

The scope of the project are

- i. To study the existing event organizer applications.
- ii. Implement the event organizer application where smartphone user with Android operating system will be targeted user.
- iii. The implemented event organizer mobile application will not handle big events like conference, ceremony, seminar and so on, it will only support small events such as gatherings, birthday party, small-scale meeting and so on.

1.5 Significance

- Facilitate users in organizing events.
- Increase involvement of all users in the events.
- Enhance communication between users to have better events despite of geographical distance.

1.6 Thesis Organization

This thesis consists of five chapter. Chapter 1 briefly explains about the introduction of project which including problem statement, objectives, project scope, significance and thesis organization.

Chapter 2 will discuss about the literature review by exploring the existing application and compare these applications.

Chapter 3 will discuss about the methodology applied in this project to develop the application, hardware and software requirement and gantt chart for this project.

Chapter 4 will discuss about testing and result discussion as well as the user manual for the developed application.

Chapter 5 will cover the conclusion of this project, constraints of the developed application and future work that can be made to improve the developed application in the future.

CHAPTER 2

LITERATURE REVIEW

2.1 Introduction

This chapter explains about the literature review of existing applications that provide event organizer function to users. Three existing application is being selected to be discussed and studied over.

2.2 Existing System

Three existing application which are Beep, Whova and Bsocial will be discussed briefly and comparison will be done on those applications.

2.2.1 Beep

Beep is a personal event application that are created by Aardvard Media Pte.Ltd. It allows user to create event, organize event, send event invitation to his friends and track their attendance with features provided. Those features included Events, Notification, Chats, Share, Check-in Location and Awesome Deals.

Firstly, user is able to create event by using event features. User only requires to fill in the event details like event name, date, time, location and invite friend from friend list or phone contact number. User also can spread the event created to Facebook by using Share feature provided. Furthermore, Beep will save all the events that the user joined inside mobile phone calendar which allows the user to organize his schedule easily. Beep also will help highlight all the upcoming events and push notification to user when the event date is closer in order to remind user regarding the events. So that, the user will not miss any event that he joined.

Besides, Beep provides Chat feature which allow user to chat with each other. User is able to chat with his friends or group chatting with others who are involved in the same events. Besides, the check-in location service allows user to easily check in any destination. This helps the event host to check attendee attendance. Lastly, Beep will provide specialized awesome deals promotion to user where all of these deals promotion is offered by Beep's affiliated merchants. User can enjoy the promotion if they select those shops as their event venue.

Unfortunately, there are many flaws in this application. There are bugs in application where user may not receive verification message after register and connection problem when signing up an account.

Figure 2.1 Beep

2.2.2 Whova

Whova is a conference and event application which won the Best Event Networking Technology in year 2016 and Event Technology Awards (ETA) in year 2017 (Whova, 2018). It is the most widely used event application by professionals for corporate event, conference and other occasions. However, it is not recommended for those who want to organize informal and casual events or gatherings because it is developed for people and company that always organize big event such as conferences, festivals, community gatherings and so on. Unfortunately, the event organizer has to pay according to the size of events and any service option that is used by organizers. The features that the application provided are Agenda, Message and Scan Card.

For Agenda, user can search and join any event or conference from the event list. User can be stayed informed about the session and speakers as Whova will list all the session on each event day. User can add the session into his own personal agenda

and set reminder. During the session, attendee is able to communicate with the event host and provide feedback and leaving comment, clicking like, rating the session.

Whova helps user to know more about people that they meet in event by allowing user to build a comprehensive profile. User is able to view all other attendees professional background information and plan in advance who to meet, what to talk about to each attendee during event. With Message feature, user is able to reach out to each other via in-application messages either by one-to-one chat or group chat. Furthermore, during or after the event, user is able to collect e-business card by scanning and quickly store their contact information electronically. This enables the user and other attendee stay in touch.

Other than the features being mentioned above, Whova also allows user to create surveys to collect feedback, document sharing and note taking. The attendee also can instantly upload photos on social media network like Twitter.

However, there is a limitation of Whova. User is only allowed to create event through website. When creating the event, user needs to fill in the online form for the event name, number of attendees and location. Then, Whova will charge the user based on this information and publish the event to event list.

Figure 2.2 Whova

2.2.3 Bsociable

Bsociable is a social calendar and event organizer application which taking into consideration of every individual schedule when planning the event. It is suitable for the use from small reunion until big corporate event. It auto-sync the calendar within user social group after permission is given by other users. So that, the user is able to check the available date of all the user who are involved in the same event. This allows user to plan and create events easily and quickly. The features provided are Events, Calendar, Chats, Dietary Preference, Integrated Map and Location Service.

For Event feature, the user starts with creating event and inviting friends into group event. The event details such as date, time and venue is set after that. The user is able to view his own calendar to check the events that he created and be invited to. With the calendar feature, the user is able to view other user calendar once the permission is given. It speeds up the planning process where the user is able to pinpoint the available date of all other user and choose the suitable date. For Group Chat feature, Bsociable provides a messaging platform not only for group chatting but also allows user to send and receive video, photo and audio. Furthermore, the Dietary Preference feature allows the user to set and suggest the food for the event. With the Integrated Map and Location Service, the user can use the integrated map to reach the event destination while event host is able to estimate the arrival time of invitees by tracking the invitees before two hour of the start time of event.

Unfortunately, there is bug in application. For example, do not receive secure code when user forgets password.

Figure 2.3 Bsociable

2.3 Comparison on Existing System

There are differences on the three existing event organizer applications. Table 2.1 shows the comparison of Beep, Whova and Bsociable.

Table 2.1 Comparison on Existing System

System	Beep	Whova	Bsociable
Application	Mobile Application	Mobile Application	Mobile Application
Platform	<ul style="list-style-type: none"> • Requires Android 4.0.3 or later. • Requires iOS 8.0 or later. 	<ul style="list-style-type: none"> • Web application for Blackberry and Windows phone. • Required Android 4.1 or later. • Requires iOS 8.0 or later. 	<ul style="list-style-type: none"> • Required Android 4.4 or later. • Requires iOS 9.0 or later.
Feature	<ul style="list-style-type: none"> • Join, Create Event, Invite People • Calendar • Chat • Share • Check-in Location • Awesome Deals Discount 	<ul style="list-style-type: none"> • Join, Create Event, Invite People • Calendar • Chat • Share • Scan E-business Card, Share Document, Slide, Note Taking 	<ul style="list-style-type: none"> • Create Events, Join, Invite People • Calendar • Chat • Integrated Map and Location Service • Dietary Preference
Limitation	<ul style="list-style-type: none"> • Bugs (Register fail, 	<ul style="list-style-type: none"> • Event organizer is 	<ul style="list-style-type: none"> • Bug (do not receive

	connection problem)	required to be charged based on size of event and service option used. <ul style="list-style-type: none"> • Only allow user creates event through website 	secure code)
--	---------------------	---	--------------

After comparing the existing event organize applications, most of the applications provide similar features such as creating, joining event, invite people, sharing the event on social media network, chat and calendar. For the Beep and Bsociable, both of the applications provide feature that helps the event host to know the arrival of invitees. This helps the event host to check which attendee attends the event. For Whova, it provides the features such as scan E-business card, sharing documents, slides and note taking which are not provided by Beep and Bsociable. Furthermore, Bsociable not only provides chat as Beep and Whova do, it enhances the chat feature by allowing users to send and receive video, audio and photo. Sometime, Beep will provide specialized awesome deals promotion to user where all of these deals promotion is offered by Beep's affiliated merchants but Whova and Bsociable do not provide such feature.

For the limitation, both Beep and Bsociable do have bugs where Beep user may not receive verification message after register and connection problem when signing up an account while Bsociable user do not receive secure code when the user forget password. Since Whova is a conference and event application that is developed for professional, it will charge the user based on the event information and it only allows user to create event and fill in the online form for the event name, number of attendees and location through their website.

CHAPTER 3

METHODOLOGY

3.1 Introduction

Each system project requires a proper methodology to develop the system which also can be called as software development methodology. It is a structure approach that acts as guideline during development process of system in order to ensure that the system achieves the objectives. This chapter will discuss about the software development methodology that is applied on this project to develop an event organizer application. In this project, Rapid Application Development (RAD) methodology is chosen.

3.2 Methodology

Rapid Application Development (RAD) is an iterative and incremental software development methodology which only involves minimal planning or no planning in the development stages. With less planning throughout the development stages, changes can be made easier during the development process. Any later requirements also can be added during development stages since it is based on iterative model. As Rapid Application Development (RAD) allows functional modules to be developed in parallel which then assembled to be a complete product, it helps reducing the development duration (Tutorials Points, 2018). There are four stages in Rapid Application Development (RAD) which are Requirements Planning, User Design, Construction and Cutover. The figure 3.1 shows the RAD life cycle.

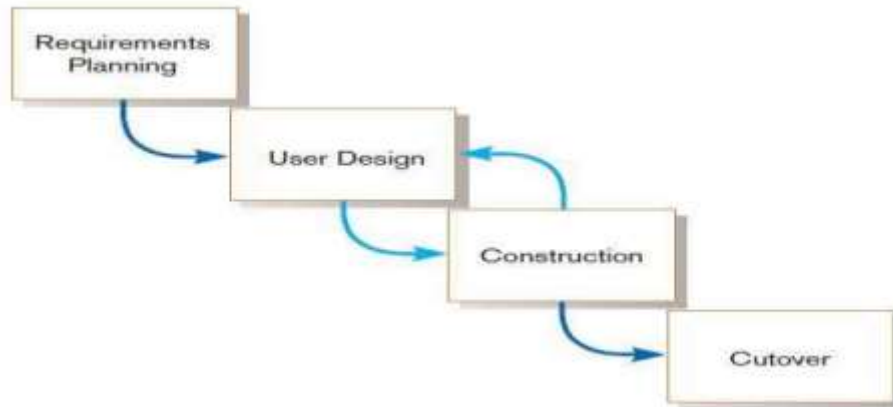

Figure 3.1 RAD Life Cycle

Requirement planning stage involves rough agreement on project scope and application requirement. In this stage, a general understanding regarding the application is established which involved title for this project, problem statement, scope, method and tools that will be used to develop the application.

During user design stage, the requirement associated with the proposed system will be analysed and the model that represent the system process will be shown by using context diagram and use case diagram.

For construction stage, it involves construction of the system where the application coding will be implemented. The improvement or any changes also can be done through this stage in order to produce a desired proposed system. In this stage, the proposed system will be coded, tested and integrated to produce an acceptable outcome.

During cutover stage, the system will be debug to ensure that it runs well with no error. Client will interact with the system to evaluate and give feedback for the application based on their requirement.

3.2.1 Context Diagram

Figure 3.2 shows the context diagram for event organizer application.

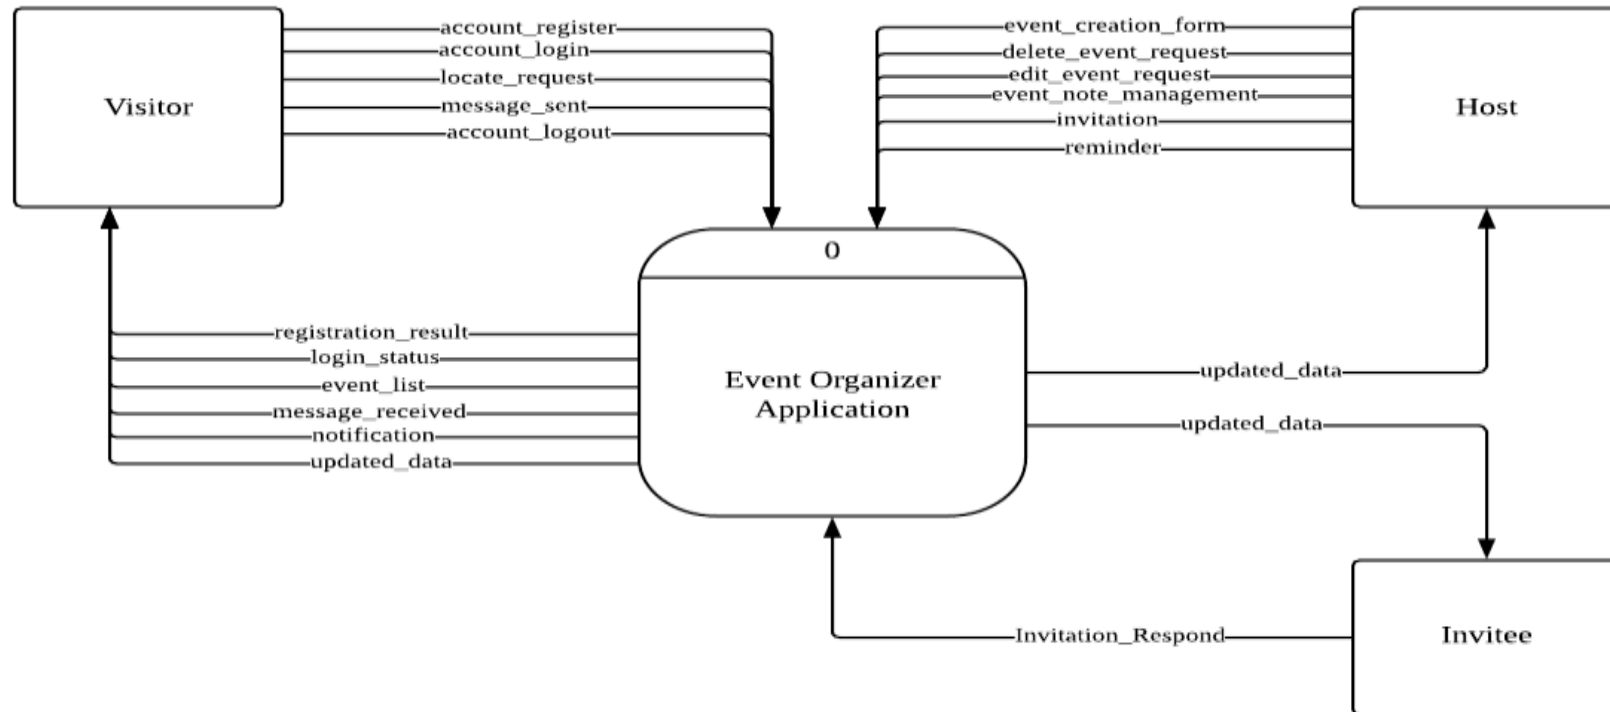

Figure 3.2 Context Diagram

3.2.2 Use Case Diagram

Figure 3.3 shows the use case diagram for event organizer application.

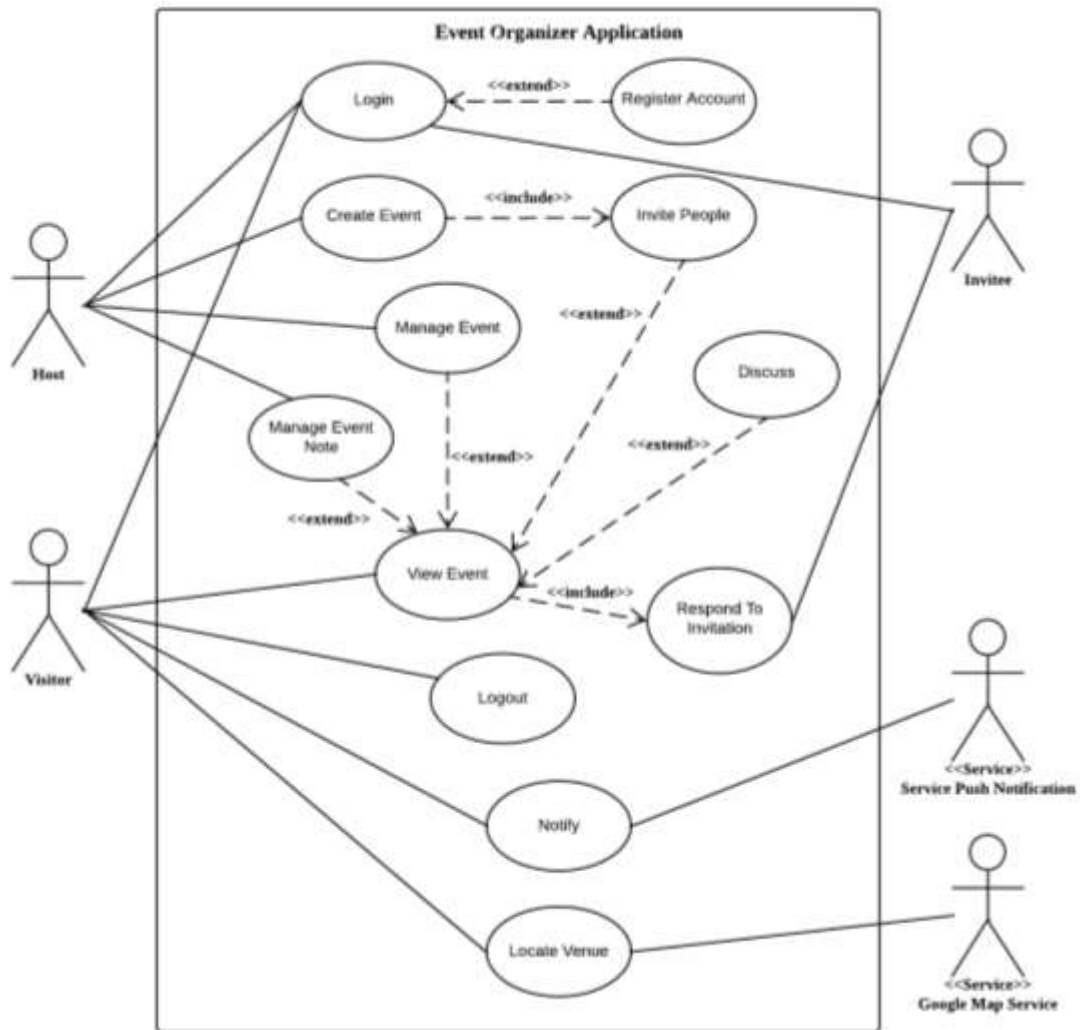

Figure 3.3 Use Case Diagram

3.2.3 Package Module

The package modules of event organizer application are shown as below.

- i. Register Module
This package is for user to register an account.
- ii. Login Module
This package is for user login into application by entering phone number and password.

- iii. **Create Event Module**
This package is used by user to create event by fill in event name, date, time and location.
- iv. **Invite People Module**
This package is used to invite people into event and event discussion room.
- v. **View Event Module**
This package is for user to view the event that he joined and created including date, time, location and so on.
- vi. **Discussion Module**
This package is used by the users to discuss about the event that they joined.
- vii. **Manage Event Module**
This package is used by host to delete event and edit the event details such as event name, date, time and location. It also used by host to set reminder.
- viii. **Manage Event Note Module**
This package is used by host to add and delete event note.
- ix. **Locate Venue Module**
This package is used by user to locate the venue for the event and guided by google map service to reach the venue.
- x. **Notify Module**
This package is used to notify user regarding the incoming chat message.
- xi. **Logout Module**
This package is used by user to logout.

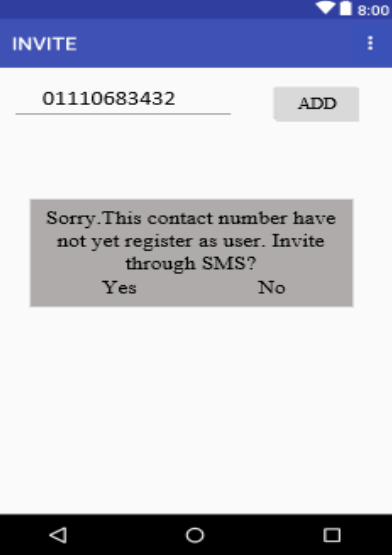

3.3 Propose Interface

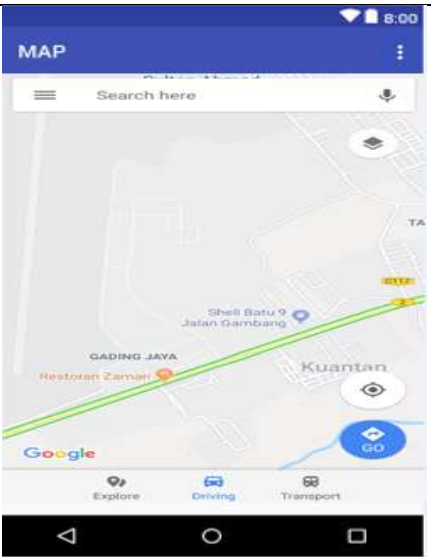

Table 3.1 shows the propose user interfaces of event organizer application.

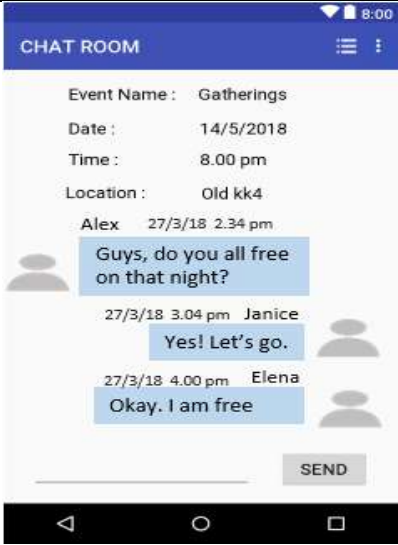

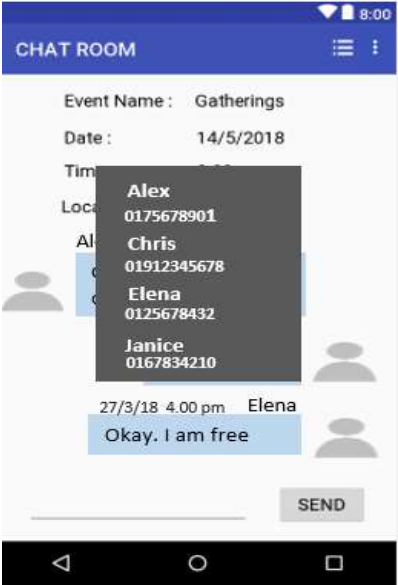

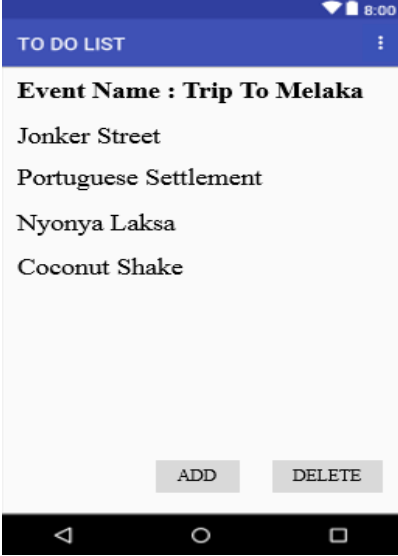

Table 3.1 Propose User Interface

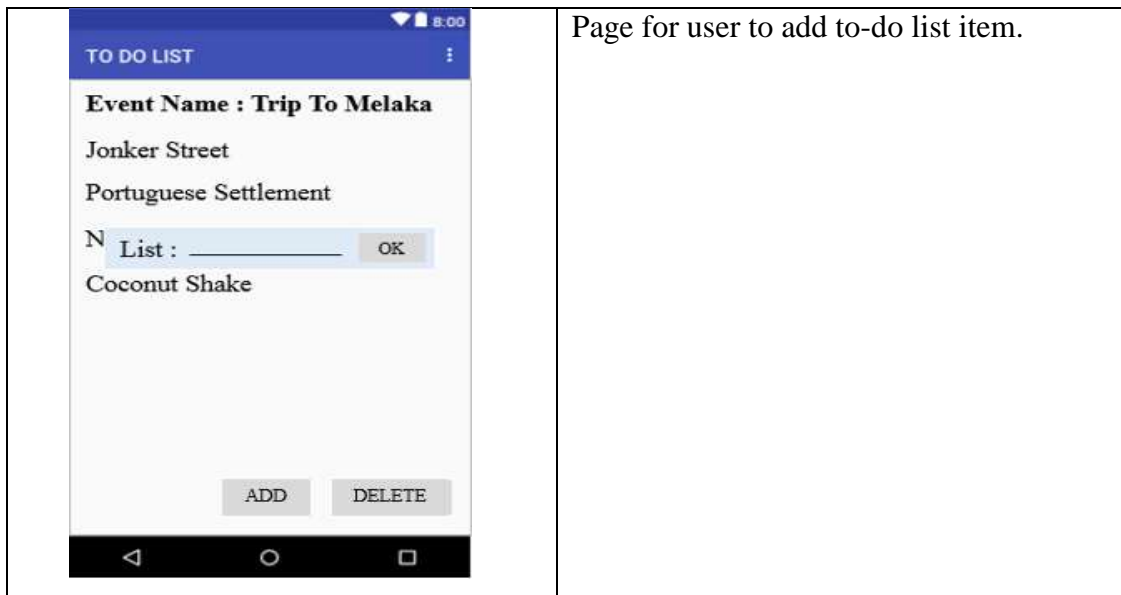

User Interface	Description
	Login page of the application.
	Sign up page for the application. If user do not have an account yet, he have to sign up an account.

	<p>Main page of the application. It shows two functions which are creating event and viewing event that the user joined or created.</p>
	<p>Page for user to create event by filling event name, date, time and location.</p>
	<p>Display calendar for user to select the date for the event.</p>

	<p>Display clock for user to select time for the event.</p>
	<p>Page for user to invite and add friend into event chat room. Dialog box pops up to confirm that the user want to add the contact number user which is the existing user to his created event.</p>
	<p>Page for user to invite and add friend into event chat room. If the contact number is not yet registered, dialog box will pop up to ask whether the user want to invite the contact number user through SMS or not..</p>

	<p>Page for displaying the event that the user created. By clicking the event showed in the list, the host will be directed to the event discussion room. By long click on the event, the host can invite people into his event, edit, delete the event and be guided to event destination.</p>
	<p>Page for displaying the event that the user joined which he was invited. By clicking the event showed in the list, the user will be directed to the event discussion room. The event that is waiting user to accept or decline invitation will be displayed in red colour. User also can be guided to reach event destination.</p>
	<p>Page for showing google map to user and direct the user go to the venue of the event.</p>

	<p>Page for user to discuss event details in order to confirm date, time, location and to follow up the event progress. User also can set up list about what to do for the event by clicking on list icon on toolbar.</p>
	<p>Page for user to know who will attend or interested in this event by clicking on the three dot menu item.</p>
	<p>Page for user to know what to do for the event. User also can add and delete the to-do list item.</p>

3.4 Hardware and Software Requirement

The hardware and software that are involved during the development of the application will be shown in the following subsection.

3.4.1 Hardware Requirement

Table 3.2 shows the hardware requirement throughout the whole project.

Table 3.2 Hardware Requirement

Hardware	Description
Laptop Mouse Keyboard	<ul style="list-style-type: none"> • To prepare documentation. • To design and develop application
Smartphone	<ul style="list-style-type: none"> • To test and run application.

3.4.2 Software Requirement

Table 3.3 shows the software requirement throughout the whole project.

Table 3.3 Software Requirement

Software	Description
Google Chrome	<ul style="list-style-type: none">• To search information online
Microsoft word 2016	<ul style="list-style-type: none">• For documentation purpose
Smartsheet	<ul style="list-style-type: none">• For scheduling the gantt chart
Microsoft PowerPoint 2016	<ul style="list-style-type: none">• To prepare presentation slide
Lucidchart	<ul style="list-style-type: none">• To draw use case diagram and context diagram
Android Studio	<ul style="list-style-type: none">• To code the application
Firebase	<ul style="list-style-type: none">• Acts as application database.

3.5 Gantt Chart

Gantt Chart for this project is scheduled to show the estimated duration to complete the project. Refer to Appendix A.

3.6 Implementation

In this section, the implementation process of event organizer application will be discussed. Event organizer application will be developed by using Java programming language. The software application which is Android Studio will be used as text editor to write the application code and set up the application interface. The code will be stimulated on smartphone with Android operating system to run and test the application. Firebase which is a cloud-hosted NoSQL real-time database will be used to store application data.

CHAPTER 4

RESULT AND DISCUSSION

4.1 Introduction

This chapter will discuss about the testing result of this project where the event organizer application is being developed. Implementation and testing will be carried out as well to ensure that the application is free from bugs and achieves the expected outcome.

4.2 Testing and Result Discussion

4.2.1 User Acceptance Testing(UAT)

User Acceptance Testing(UAT) is used to test the functionality of the developed application. The testing will go through each functionality along with the interaction of user with the application. Thus, result is observed during testing where the relevant data will be entered by user. The functions included are sign up account, login, create event, edit event details, delete event, view event, invite people, accept or reject invitation, view calendar, manage profile, navigation, quit from joined event, view invitation status, view invitee information, view event note, add and delete event note, set reminder, send and receive chat message and receive push notification. This testing aims to detect the defect and ensure that the application is working fine. The full UAT is attached in Appendix B.

4.2.2 Result Discussion

After the user acceptance testing(UAT) is done, it proved that the event organizer application is working well. It meets all the objectives of this project and able to handle error or exceptions such as non-registered email login, left required field

blank when create event. From the UAT, the tester is unable to login with non-registered email and invalid password. The event also cannot be created if the required field left blank. Furthermore, all the functionalities that provided by event organizer application are able to perform well as they are tested as shown on Appendix B. The tester is able to sign up account, login, create event, edit event details, delete event, view event, invite people, accept or reject invitation, view calendar, manage profile, navigation, set reminder, quit from joined event, send and receive chat message, view invitation status, view invitee information, view event note, add and delete event note. Besides, the tester also successfully receives push notification when there is any incoming message, invitation is accepted or rejected by invitee, attendee quit from event, event note is added or modified by host, event details is updated by host, event is deleted by host. The event organizer application successfully passed the UAT which was done by testers as it able to perform well during the test.

4.3 User Manual

User manual is being established to provide guidance to user on how to use the event organizer application. It briefly describes functionalities of application, steps and constraints to use the application. The completed user manual can be referred to Appendix C.

CHAPTER 5

CONCLUSION

5.1 Introduction

As a conclusion, event organizer application is developed to help people to organize event effectively regardless of busy life and geographical distance. It provides a platform with various functions for people to handle event. The functions included are sign up account, login, create event, edit event details, delete event, view event, invite people, accept or reject invitation, view calendar, manage profile, navigation, quit from joined event, view invitation status, view invitee information, view event note, add and delete event note, set reminder, send and receive chat message and receive push notification. With chat function, user can communicate and discuss with each other easily. Better understanding about event flow can be achieved with the event note. With reminder and push notification, the risk of missing any event and information is reduced as the reminder can be set by host to remind the attendees about the event that will be organized soon and push notification will be received if there is any incoming chat message, invitation is accepted or rejected, attendee quit from event, event note is modified, event details is updated and event is deleted. Event organizer application is developed as mobile application which is convenient and easy for people to use at any time and everywhere. It successfully achieves the objectives with its features.

5.2 Research Constraint

Constraint for this project are

- I. Event organizer application is not able to perform well without access to internet connection as it requires internet for data transferring between database and application.

- II. Event organizer application can be used by Android smartphone user only.

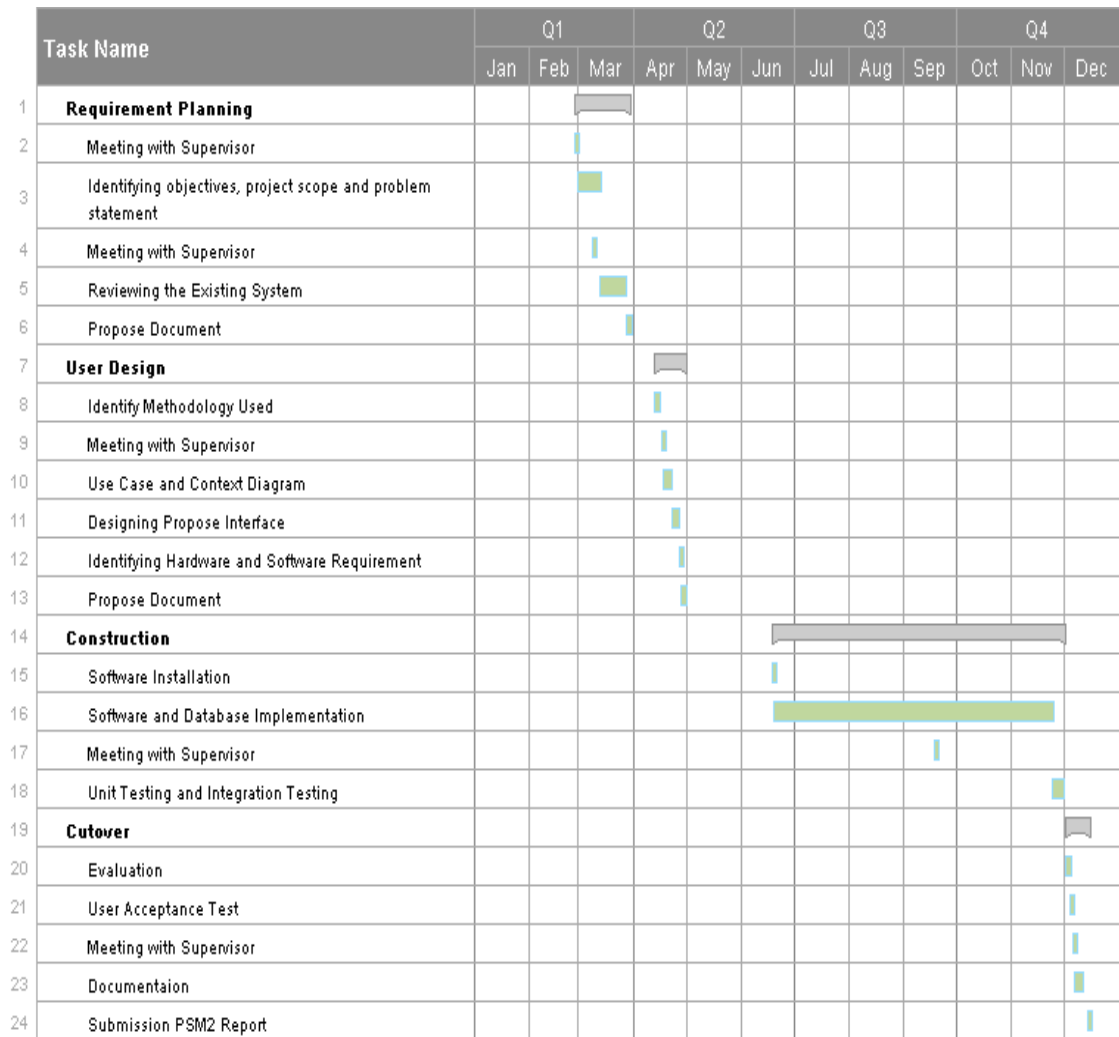

5.3 Future Work

Event organizer application is currently developed for Android smartphone user only. For future plan, it will be developed in vary mobile platform. Besides, it will be developed to allow access during offline mode which means that the application still can be used when there is no internet connection.
