

STUDY ON PERCEPTION OF BIM
EFFECTIVENESS WITHIN CONSTRUCTION
INDUSTRY

NIK NUR ASYRAF BIN AZHARI

Degree of Civil Engineer

UNIVERSITI MALAYSIA PAHANG

SUPERVISOR'S DECLARATION

I/We* hereby declare that I/We* have checked this thesis/project* and in my/our* opinion, this thesis/project* is adequate in terms of scope and quality for the award of the degree of *Doctor of Philosophy/ Master of Engineering/ Master of Science in

.....*Civil Engineering*.....

A handwritten signature in black ink, appearing to read 'Zahrizan Bin Zakaria', is written over a horizontal line. Below the signature, the text '(Supervisor's Signature)' is printed in a smaller font.

Full Name : Zahrizan Bin Zakaria

Position : LECTURER

Date : 14 January 2019

STUDENT'S DECLARATION

I hereby declare that the work in this thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at Universiti Malaysia Pahang or any other institutions.

A handwritten signature in black ink, appearing to be 'Nik Nur Asyraf Bin Azhari', is written above a horizontal line.

(Student's Signature)

Full Name : NIK NUR ASYRAF BIN AZHARI

ID Number : AA14130

Date : 14 January 2019

STUDY ON PERCEPTION OF BIM EFFECTIVENESS WITHIN
CONSTRUCTION INDUSTRY

NIK NUR ASYRAF BIN AZHARI

Thesis submitted in fulfillment of the requirements
for the award of the degree of
Doctor of Philosophy/Master of Science/Master of Engineering

Faculty of Civil Engineering & Earth Resources

UNIVERSITI MALAYSIA PAHANG

JANUARY 2019

ACKNOWLEDGEMENTS

I would like to express my most gratitude and appreciation towards all those people who had gave me the chance to complete this thesis. Special thanks to my supervisor, Mr. Zahrizan Bin Zakaria due to his help in stimulating suggestions and helping me throughout my final year project during this two semesters. A lot of help have been received from him during this time regarding the idea and guidelines required in order to complete this thesis. I also sincerely would like to thank him for all the time he had spent on proofreading and correcting my many mistakes during these period. I also would like to offer gratitude towards Ms. Nurul Nadrah Aqilah Binti Tukimat, our coordinator for final year project for teaching me about preparation and thesis writing guide for final year project in class and coordinating the students involved with final year project through the semesters. Apart from that, my gratitude are also directed to the all of the lecturers who have given their full effort in guiding the students in achieving the goal as well as their encouragement to maintain our progress in check. My profound thanks also towards all of my friends during 4 years being in UMP, especially those who are to spend their time in helping and giving support whenever I need it in fabricating my project. Not forgetting, special thanks also directed towards all of the personals involved during this research especially those who were willing to spend their time answering my questionnaire.

ABSTRAK

Pemodelan Maklumat Bangunan (BIM) merupakan salah satu teknologi baru yang diperkenalkan kepada pemain berkaitan pembinaan sebagai alat berkomunikasi utama dalam projek pembinaan. BIM telah banyak digunakan di banyak negara. Di Malaysia, idea untuk melaksanakan BIM diperkenalkan oleh Pengarah Jabatan Kerja Raya (PWD) pada tahun 2007. BIM telah mula mengubah bagaimana pereka bekerjasama dengan perunding dan pembina, dan juga mempunyai keupayaan untuk membimbing industri ke arah pengeluaran bangunan memenuhi matlamat pembangunan mampan dan operasi kemudahan modal baru atau kemudahan yang dimodelkan semula (moden). Kerajaan telah mula menggalakkan pemain berkaitan pembinaan Malaysia untuk beralih dari amalan semasa ke pelaksanaan BIM. Pelaksanaan BIM dalam industri pembinaan tanpa ragu-ragu telah memberikan beberapa kelebihan ke arah pihak-pihak pembinaan di seluruh dunia. Keberkesannya telah dibuktikan oleh beberapa pihak di seluruh dunia. Walau bagaimanapun, masih belum pasti di mana aspek semasa projek pembinaan BIM boleh dilihat sebagai yang paling berkesan. Kajian ini bertujuan untuk mengenal pasti aspek yang paling penting semasa projek pembinaan dimana BIM boleh dikatakan sebagai yang paling berkesan. Maklumat ini penting bagi pemain pembinaan untuk menarik mereka ke arah pelaksanaan BIM di Malaysia. Untuk mencapai matlamat kajian ini, semakan kajian semula secara intensif dan temu duga dilakukan di samping soal selidik yang digunakan untuk responden. RII digunakan untuk menganalisis data. Dari kajian ini, kami mendapati bahawa BIM masih belum digunakan secara meluas di Malaysia mengikut data yang diterima daripada tinjauan soal selidik dan kajian literatur yang dijalankan. Selain daripada itu, dari data kaji selidik juga, kita dapat menyimpulkan bahawa faktor yang dianggap sebagai yang paling penting di antara faktor-faktor yang dipilih adalah keupayaan BIM untuk melakukan pemeriksaan pertembungan bagi keseluruhan model reka bentuk yang telah dimuktamadkan. Data tinjauan juga menunjukkan bahawa aspek yang mana BIM boleh dikatakan sebagai yang paling berkesan ialah semasa bantuan reka bentuk dan pembinaan. Kesimpulannya, kajian ini berjaya mencapai matlamat yang dicadangkan. Hasil daripada kajian ini tidak jauh dari hasil yang dijangkakan yang pelaksanaan BIM di Malaysia masih rendah dan ia adalah yang paling berkesan semasa aspek bantuan reka bentuk dan pembinaan. Mudah-mudahan, semua maklumat yang disediakan di dalam tesis ini dapat memberi semangat kepada para pemain pembinaan untuk menggunakan BIM dalam projek masa depan mereka.

ABSTRACT

Building Information Modelling (BIM) is one of the newer technologies introduced to the construction related players as the principal communicating tools in the construction project. BIM has been widely used in many countries. In Malaysia, the idea to implement BIM was introduced by the Director of Public Works Department (PWD) in 2007. BIM has already begun changing how designers collaborate with consultants and builders, and it also has the capability to guide the industry towards the production of buildings meeting sustainable development goals and operation of a new capital facility or a recapitalized (modernized) facility. The Government has started to encourage Malaysian construction related players to shift from current practices to BIM implementation. BIM implementation in construction industry without a doubt had provided several advantages towards the construction parties around the world. Its effectiveness has been proven by several parties across the globe. However, it is still uncertain in which aspect during construction projects does BIM can be viewed as the most effective. This study aims to identify the most crucial aspect during construction project where BIM can be said as being the most effective. These information is crucial to construction players in order to attract them towards BIM implementation in Malaysia. To achieve the aim of the study, intensive review literature review and interview were conducted beside deployed questionnaires to the respondents. RII were used to analyze the data. From the study, we found that BIM was still not yet widely used in Malaysia according to the data received from conducted questionnaire and literature reviews. Other than that, from the survey data also, we can concluded that the factor which deemed as the most important among the factors chosen was the BIM capability to do clash checking for the whole finalized design model. The survey data also indicated that the aspect where BIM can be said as being the most effective was during design assistance and constructability. In conclusion, this study managed to achieve the proposed objective. The outcome from this study does not stray far away from the expected outcome which is BIM implementation in Malaysia is still low and it is the most effective during aspect of design assistance and constructability. Hopefully, all the information provided inside this thesis can provide encouragement towards construction players to use BIM in their future projects.

CHAPTER 1

INTRODUCTION

1.1 Introduction

Building Information Modelling (BIM) is one of the newer technologies introduced to the construction related players as the principal communicating tools in the construction project. BIM has been widely used in many countries such as United Kingdom, United States, Australia, Singapore and etc. Many construction players have started to realize the significant benefit offered by BIM and working towards BIM implementation. In Malaysia, the idea to implement BIM was introduced by the Director of Public Works Department (PWD) in 2007. In 2010, Malaysian Government has announced that the National Cancer Institute, Sepang is the first infrastructure construction project adopting BIM in Malaysia.

Building Information Modelling (BIM) is the development and use of a multi-faceted computer software data model to not only document a building design, but to simulate the construction. BIM consists of information representing the entire building and the complete set of design documents stored in an integrated database. All the information is parametric and thereby interconnected. Any changes to an object within the model automatically affect the related assemblies and constructions, because the model contains the necessary relational information. This is quite unlike the 2D building representation of conventional CAD-based drawings. For these reasons, BIM has already begun changing how designers collaborate with consultants and builders, and it also has the capability to guide the industry towards the production of buildings meeting sustainable development goals and operation of a new capital facility or a recapitalized (modernized) facility. The resulting Building Information Model is a data-rich, object-based, intelligent and parametric digital representation of the facility, from which views

appropriate to various users' needs can be extracted and analysed to generate feedback and improvement of the facility design.

1.2 Background of Problems

As we know, Building Information Modelling (BIM) implementation has been introduced to construction industry in Malaysia a few years ago. BIM has been included and become part of national agenda under the Construction Industry Transformation Program (CITP). CITP is a five-year program (2016-2020) developed by Construction Industry Development Board Malaysia (CIDB) and was launched by the Prime Minister in September 2015 with the intention to guide, refocus the strategic position and plot the future direction of Malaysian construction industry. Therefore, the Government has started to encourage Malaysian construction related players to shift from current practices to BIM implementation.

BIM implementation in construction industry without a doubt had provide several advantages towards the construction parties around the world. Its effectiveness has been proven by several parties across the globe. However, it is still uncertain in which aspect during construction projects does BIM can be viewed as the most effective. This matter is crucial to construction players in deciding whether they should implement BIM in their projects. In fact, most of them still unclear about in which aspect BIM can actually provide benefits to their projects. Due to their lack of understanding on this matter, they became uncertain about changing their common practices into BIM which in their views, considered as a risky move. They are unsure whether they could actually gain any benefits by doing so. Misunderstanding or lack of knowledge on this matter is clearly one of the reasons why BIM are not widely accepted by construction players in Malaysia. Therefore, a clear guidance regarding this matter need to be provided on how BIM can actually being effective in construction project.

1.3 Problem Statement

BIM implementation in construction industry without a doubt had provided several advantages towards the construction parties around the world. Its effectiveness has been proven by several parties across the globe. However, it is still uncertain in which aspect during construction projects does BIM can be viewed as the most effective. This, due to their lack of understanding on this matter, they became uncertain about changing their common practices into BIM which in their views, considered as a risky move. They are unsure whether they could actually gain any benefits by doing so. Therefore, this study will analyse the most crucial aspect where BIM can be said being as the most effective.

1.4 Importance of Study

The adoption and use of Building Information Modelling (BIM) in the whole life process of designing, creating and operating buildings, assets and infrastructure projects is a worldwide growing trend. The research findings presented here are aimed to clearly state on how BIM can become effective during the construction project. The information are obtained from construction players or any related parties which happen to have experience with BIM. The research findings are intended to be used as a reference by construction players while deciding whether or not they should use BIM in their projects. By providing clear understanding on how BIM can actually benefits them, BIM implementation among construction players in Malaysia can be increased significantly.

BIM are viewed as a superior method compared to conventional method. BIM and other digital trends such as big data and sensors have potential wide-reaching implications for many industries around the world. In 2009, Malaysia was first introduced to the term BIM during the 2-day Infrastructure & Construction Asia's Building Information Modelling & Sustainable Architecture Conference. At the conference, Y. Bhg Dato' Seri Ir. Dr. Judin bin Abdul Karim, then as the Director General of Public Work Department (PWD), urged the industry to embrace technology in their deliverables.

The Malaysian government then announced its adoption of BIM in 2010 with the National Cancer Institute in Sepang being the first infrastructure construction project. Currently, both the government and the private sector is slowly adopting BIM in the projects. Several BIM platforms currently available in the market includes Revit, Bentley
