

DEVELOPMENT OF REGENERATIVE PIEZOELECTRIC LINEAR GENERATOR  
FOR ALTERNATIVE POWER GENERATION

SITI NUR SAKINAH BINTI JAMALUDIN

A thesis submitted in fulfilment of the requirements  
For the awards of the degree of  
Master of Engineering in Automotive

Faculty of Mechanical Engineering  
UNIVERSITI MALAYSIA PAHANG

AUGUST 2011

### **SUPERVISOR'S DECLARATION**

I hereby declare that I have checked this thesis and in my opinion, this thesis is adequate in terms of scope and quality for the award of the degree of Master of Engineering in Automotive.

Signature : .....

Name of Supervisor : PROF. DR. ROSLI BIN ABU BAKAR

Position : SENIOR LECTURER

Date : .....

## STUDENT'S DECLARATION

I hereby declare that the work in this thesis is my own except for quotations and summaries which have been duly acknowledged. The thesis has not been accepted for any degree and is not concurrently submitted for award of other degree.

Signature : .....

Name : SITI NUR SAKINAH BINTI JAMALUDIN

ID Number : MMA08001

Date : .....

<b>CHAPTER 1 INTRODUCTION</b>	
1.1 Background of Study	1
1.2 Problem Statement	2
1.3 Hypothesis	3
1.4 Objectives	3
1.5 Scopes	4
1.6 Methodology	4
1.7 Schedule of Work	5
<b>CHAPTER 2 LITERATURE REVIEW</b>	
2.1 Introduction	6
2.2 Development of Electromechanical Devices	6
2.3 Mini Generators as A Power Source	7
2.4 Fundamental of Piezoelectricity	7
2.4.1 Piezoelectric Materials	9

2.4.2	Piezoelectric Effects	9
2.4.3	Equations of Piezoelectricity	12
2.4.4	Piezoelectric Properties	14
2.5	Previous Researches on Piezoelectric Generator	15
2.6	Types of Piezoelectric Actuator	17
2.7	Piezoelectric Elements Characteristic	20
2.8	Applications of Piezoelectric Generator	26
2.9	Design Guidelines	26
2.10	Frequency Pulse Wave Generation	28
2.11	Equations for Periodic Signal	31
2.12	Methods of Damping	32

### **CHAPTER 3 RESEARCH METHODOLOGY**

3.1	Introduction	35
3.2	Literature Study	37
3.3	Conceptual Design	37
3.4	Actuation Part Design	39
3.5	3D Modelling of The Components	41
3.6	Proposed Piezoelectric Generator Design	42
3.7	Proposed Test Rig Design	42
3.8	Performance Testing Procedure	44
	3.8.1 Variable DC Pulse Generation	45
	3.8.2 Performance Testing within Different Input Force	50
	3.8.3 Performance Testing within Different Input Frequency	52
	3.8.4 Performance Testing within Different Input Load Duration	53
3.9	Materials Selection	54
3.10	Prototyping	55
	3.10.1 Moving Components	55
	3.10.2 Non-moving Components	66
	3.10.3 Electronics Component	68
3.11	Real System Preliminary Testing Procedure	70
3.12	Design Limitations	72

## **CHAPTER 4 RESULTS AND DISCUSSION**

4.1	Actuation Part Design	73
4.2	Complete Design of The Regenerative Piezoelectric Linear Generator	79
4.3	Manual Testing Results	83
4.4	Experimental Testing Apparatus Setup	84
4.5	Experimental Performance Testing Results	88
	4.5.1 Force Analysis	89
	4.5.2 Frequency Analysis	98
	4.5.3 Duration Analysis	105
4.6	Results on Actual Condition Preliminary Testing	108
4.7	Discussion on Possible Applications	112
4.8	Discussion on The Errors within The Signals	113

## **CHAPTER 5 CONCLUSION AND RECOMMENDATIONS**

5.1	Conclusion	114
5.2	Recommendations	115

3.5	Inner parts movement and harvesting approaches of the regenerative piezoelectric linear generator	40
3.6	Power regeneration mechanism and the assembled structure of the suspension and generator system	41
3.7	Schematic diagram for the proposed test rig design	43
3.8	PC Software used for the outputs data measurement	44
3.9	Dimension of the tubular push linear solenoid actuator used as the input variable medium for the testing	44
3.10	Basic concept for DC pulse generation	45
3.11	The component symbol and the actual pin arrangement of <i>Timer IC 555</i>	46
3.12	Circuit diagram of the frequency pulse generator	47
3.13	Precision current limiter for $IC_2$ circuit	48
3.14	The electronic components arrangement in the input variables control panel box	49
3.15	Electrical outputs measuring instruments	50
3.16	The pulls back system mechanism for the actuator stroke	51
3.17	Effect of stroke length on the actuation force of the chosen tubular solenoid push actuator	52
3.18	Effect of stroke length on the actuation speed of the chosen tubular solenoid push actuator	53
3.19	Gape length between the actuation part components	56
3.20	Separation area of the protection plate for layer by layer fabrication	57
3.21	3D modelling preparation for the prototyping process using <i>4-axis Modular Machine</i>	57
3.22	Material preparation for the protection plate fabrication	58
3.23	Illustrations on 3D modelling and fabricated plate holder for machining using <i>4-axis Modular Machine</i>	59

3.24	Illustrations on the attachment of the plate holder and protection plate work piece process	61
3.25	Differences on the work piece shape in the layer by layer fabrication	62
3.26	Fabrication processes for moving parts prototyping	65
3.27	Fabrication processes for non-moving parts prototyping	66
3.28	Exploded view of the frequency generator prototyping model	68
3.29	Assembly view of the power regulation, <i>Timer IC 555</i> panel	69
3.30	Illustration on real system testing mechanism	71
4.1	Finalized design for the actuation part of the regenerative piezoelectric linear generator	74
4.2	Ready made piezoelectric plate used for the actuation part development	74
4.3	Finish product of the moving parts of the regenerative piezoelectric linear generator	76
4.4	Critical dimensions in the actuation part of the piezoelectric generator	78
4.5	Suspension that used as the damping system in the piezoelectric generator configuration	79
4.6	Fabricated actuation part of the regenerative piezoelectric linear generator	79
4.7	Complete system of the developed regenerative piezoelectric linear generator	81
4.8	The regenerative piezoelectric linear generator after installed into the mini scooter	82
4.9	Manual preliminary testing done on the designed piezoelectric stack	83
4.10	3D model of the designed test rig for the experimental performance testing of the piezoelectric generator	84
4.11	Fabricated test rig structure for the experimental performance testing	86

4.12	The developed power regulation panel box for experimental testing purpose	86
4.13	Complete apparatus setup for the experimental performance testing	86
4.14	Tubular solenoid push actuator used in the test rig structure	87
4.15	Periodic voltage signals captured from different input force testing	90
4.16	Effect of input force on the output current achieved by the tested element	91
4.17	Periodic voltage signals captured from 1 until 5 layers of stack testing	93
4.18	Effect of the stack layer number on the output current achieved by the tested element (1-5 layers)	94
4.19	Periodic voltage signals captured from 5 until 20 layers of stack testing	96
4.20	Effect of the stack layer number on the output current achieved by the tested part (ranged 5-20)	97
4.21	Periodic voltage signals from different input frequency ranged between 1Hz until 20Hz testing performed on 2 layers of stack	99
4.22	Periodic voltage signals from different input frequency ranged from 1Hz until 20Hz testing performed on 10 layers of stack	101
4.23	Periodic voltage signals from frequency inputs range from 1Hz until 20Hz testing performed on 20 layers of stack	103
4.24	Effect of different input frequency on the output power achieved by different number of the stack layer	104
4.25	Periodic voltage signals from different duty cycle on the input testing	106
4.26	Effect of the duty cycle percentage on the output power for the load duration analysis	107
4.27	Periodic voltage signal from the 50kg's loading testing	110
4.28	Periodic voltage signal from the 80kg's loading testing	111

## LIST OF SYMBOLS

### *Capital letters*

$C_l$	Capacitance in Farads with variable ranges
$D_i$	Electric displacement
$E$	Electric field
$F_{out}$	Output force
$I_{out}$	Current output in amperes
$L$	Displacement
$\Delta L$	Displacement change
$P$	Polarization
$P_{ave}$	Average power
$P_o$	Peak power
$R$	Resistance
$T$	Cycle time in seconds
$T_m$	Mark Time in seconds
$T_s$	Space Time in seconds
$V_{in}$	Input voltage
$V_{p-p}$	Rated voltage
$T$	Pulse length

### *Lower case letters*

$d_{ij}$	Piezoelectric Modulus
$d_{31}$	Piezoelectric strain constant in the 1-axis induced due to a unit applied field in the 3-axis

$d_{33}$	Piezoelectric strain constant in the 3-axis induced due to a unit applied field in 3-axis
$k_x$	Stiffness value at various operating range
$pF$	Electrostatic capacity
$s$	Non-zero piezoelectric effect

***Greek symbols***

$\sigma_j$	Applied mechanical stress
$\varepsilon$	Dielectric constant
$\varepsilon_{ij}$	Dielectric constant Modulus
$\varepsilon_{pulse}$	Energy pulse strain, Bandwidth parameter
$\lambda_j$	Applied mechanical strain

**LIST OF ABBREVIATIONS**

ABS	American Bureau of Shipping
AISI	American Iron and Steel Institute
BaTiO <sub>3</sub>	Ceramic Barium Titanate
CAD	Computer Added Design
DC	Direct Current
FET	Field-Effect Transistor
HB	Hard Black
IC	Integrated Circuit
LED	Light Emitting Diode
MAX	Maximum
MEMS	Micro Electro Mechanicals
MFC	Multi Fibre Composites
PC	Personal Computer
PVDF	Polyvinyl Fluoride
PZT	Piezo Zirconate Titanate
RPM	Regulations Per Minute
SiO <sub>2</sub>	Quartz
SiTHy	Static Inductance Thyristor
SCRs	Silicon Controlled Rectifier
UL	Ultra Light
2D	Two Dimensions
3D	Three Dimensions

## ABSTRACT

The unique ability of piezoelectric materials shows their potential in harvesting power for the application of micro to miniature power source range of devices in the industry. Focus on the suspension operating system which produces waste vibrating energy as a source of power, a conceptual design of a regenerative piezoelectric linear generator was developed by considering some factors including the dimensions, shapes, maintenance convenience and material behaviour. In this project, piezoelectric plate used in a buzzer was modified to be a multilayer stack as an actuation element for the regenerative piezoelectric linear generator which able to supply power for certain applications. The performance of the fabricated prototype had been tested on a specific testing rig within some inputs variables in terms of different force magnitude, speed and load duration. The preliminary testing on the real system of the generator also performed where two loadings from 50kg's and 80kg's person bouncing had been considered. The experimental testing had agreed the hypothesis made where the model configurations and the mechanism of power harvesting implemented could influence the power output achieved by the system. The proposed design is proved able to achieve more power within more smart material thickness and layers. It also able to works within different frequencies and load duration that refer to variety of road conditions we have in our country. The average output power achieved was reached until 1.33mW and the value could be enhanced within the addition of piezoelectric plate thickness and layers. This thesis elaborated the whole process of designing the generator from the first brainstorming of conceptual design until the recommendation of the designed model.

## ABSTRAK

Kelebihan unik yang terdapat pada bahan pizelektrik menunjukkan potensinya dalam penghasilan kuasa untuk aplikasi sumber kuasa mikro kepada miliwatts pada alat-alat yang dihasilkan dalam industri. Dengan memfokuskan kepada operasi sistem suspensi yang menghasilkan lebih tenaga getaran sebagai sumber kuasa, satu rekaan konsep penjanakuasa pizelektrik telah dicadangkan dengan mengambil kira beberapa faktor termasuklah ukuran, bentuk, kesesuaian penyelenggaraan dan sifat bahan. Dalam projek ini, kepingan pizelektrik yang digunakan dalam penggera telah diubahsuai untuk dijadikan satu tingkatan lapisan sebagai elemen penggiat untuk penjanakuasa pizelektrik yang berupaya untuk menghasilkan kuasa untuk aplikasi tertentu. Keupayaan rekaan model contoh telah diuji pada satu radas ujikaji yang spesifik dengan beberapa pembolehubah berdasarkan perbezaan daya, kelajuan, dan tempoh masa. Beberapa ujian percubaan awal pada sistem generator sebenar juga telah dilakukan di mana dua beban daripada henjutan individu 50 kilogram dan 80 kilogram telah diambilkira. Ujian percubaan tersebut telah mengesahkan hipotesis yang dibuat iaitu penyelarasan model dan mekanisme penghasilan kuasa yang dibuat boleh mempengaruhi hasil kuasa yang diperolehi oleh sistem. Cadangan rekaan tersebut telah disahkan berupaya untuk memperolehi lebih kuasa dengan lebih banyak ketebalan dan lapisan bahan yang berkualiti. Ia juga berupaya untuk beroperasi dengan perbezaan frekuensi dan tempoh masa beban yang merujuk kepada kepelbagaian keadaan jalan di negara ini. Hasil kuasa tertinggi yang diperolehi adalah sehingga  $1.33mW$  dan nilai tersebut boleh ditingkatkan dengan penambahan ketebalan dan lapisan kepingan pizelektrik. Tesis ini menghuraikan keseluruhan proses rekaan generator bermula daripada idea awal rekaan konsep sehingga cadangan penambahbaikan model rekaan tersebut.
