

**FINITE ELEMENT ANALYSIS OF FACTORY
PORTAL FRAME BY USING ANSYS**

PRISCILLIA CHAI LI HSIA

B. ENG (HONS.) CIVIL ENGINEERING

UNIVERSITI MALAYSIA PAHANG

SUPERVISOR'S DECLARATION

I hereby declare that I have checked this thesis and in my opinion, this thesis is adequate in terms of scope and quality for the award of the Bachelor Degree of Civil Engineering

(Supervisor's Signature)

Full Name : CHENG HOCK TIAN

Position :

Date : 30 May 2019

STUDENT'S DECLARATION

I hereby declare that the work in this thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at Universiti Malaysia Pahang or any other institutions.

(Student's Signature)

Full Name : PRISCILLIA CHAI LI HSIA

ID Number : AA15232

FINITE ELEMENT ANALYSIS OF FACTORY PORTAL FRAME
BY USING ANSYS

PRISCILLIA CHAI LI HSIA

Thesis submitted in fulfillment of the requirements
for the award of the
B.Eng (Hons) Civil Engineering

Faculty of Civil Engineering and Earth Resources
UNIVERSITI MALAYSIA PAHANG

MAY 2019

This study is especially dedicated to my beloved family, project supervisor, and my friends for their continuous support and care throughout my studies.

ACKNOWLEDGEMENTS

First of all, I would like to give sincere gratitude to my Supervisor, Dr. Cheng Hock Tian. Along my research project, he had provided a lot of guidance and help to me in order to finish my research in time. Besides, he had also provided several examples and tutorials for me to learn about the ways to use the ANSYS software.

Furthermore, I truly appreciated the supports which have been given by my family members throughout the final year project. I would also like to give a million thanks to my course mates for helping me out by providing some suggestions and advices, so that I am able to complete my final year project. Without their help, I am unable to complete my final year project smoothly.

In addition, I am thankful to UNIVERSITY MALAYSIA PAHANG for providing me an opportunity to do my research and final year project. I feel contented to be able to learn using ANSYS software right before graduation. This is a very useful experience and skill which I can apply in my future career.

ABSTRACT

In this research, a factory portal frame has been analysed by using ANSYS software. This research is to determine the strain, stress, maximum deflection, deformation and also checking the structure according to Eurocode 3. Major of the buildings constructed in Malaysia are reinforced concrete buildings compared to steel frame buildings. However, steel is commonly used in portal frame design. Steel structure design software is very important to help civil engineers in finite element analysis. The type of material and the geometry for the structure was satisfied in in cases it passed all the designing for tensile, buckling and compression. The values for the input variables are generated randomly by using Monte Carlo Simulation with given mean values and standard deviation or as prescribed samples using Response Surface Method. From the result of simulation, we can know the behaviour of the steel frame structure under the input parameter that applied. Then, from the probabilistic analysis, we collect the result of cumulative distribution function, the histogram plot for input and output parameter, sensitivity plot and simple history plot for all parameter.

ABSTRAK

Dalam kajian ini, sebuah bingkai keluli kilang telah dianalisis menggunakan perisian ANSYS. Kajian ini adalah untuk menentukan ketegangan, tekanan, pesongan maksimum, ubah bentuk dan juga menyemak struktur mengikut Eurocode 3. Kebanyakan bangunan yang dibina di Malaysia adalah bangunan konkrit bertetulang berbanding bangunan bingkai keluli. Manakala, keluli selalu digunakan dalam reka bentuk bingkai keluli. Perisian reka bentuk struktur keluli adalah sangat penting untuk membantu jurutera awam dalam analisis unsur terhingga. Jenis bahan dan geometri untuk struktur itu berpuas hati dalam kes-kes yang melepasi semua reka bentuk untuk tegangan, geseran dan pemampatan. Nilai-nilai untuk pemboleh ubah masukan dijana secara rawak dengan menggunakan Simulasi Monte Carlo dengan nilai min dan sisihan piawai atau sampel yang ditetapkan menggunakan Kaedah Surface Response. Dari hasil simulasi, kita dapat mengetahui kelakuan struktur bingkai keluli di bawah parameter input yang digunakan. Kemudian, dari analisis probabilistik, kami mengumpul hasil fungsi pengedaran kumulatif, plot histogram untuk input dan output parameter, plot kepekaan dan plot sejarah mudah untuk semua parameter.

CDF	Cumulative distribution function
MAXIMUMDEFLECTION /MAX_DEFLECTION	Maximum Deflection

CHAPTER 1

INTRODUCTION

1.1 General

Multiple types of frames are used in steel construction industries. It is noted that steel portal frame is favoured frame that is used to build single-storey industrial buildings. There are many advantages of steel portal frame to be used compared to structural portal frame. One of it is steel portal frame can be erected and built easily. The steel structural elements of portal frame can be fabricated before being transported to construction site. Besides, it is more cost effective compared to structural portal frame, thus, saving the clients lots of money.

In this research, a model of factory steel portal frame will be proposed and modelled by using the software ANSYS+CivilFEM 12.0 in three dimensions, a finite element analysis calculation will be performed through the software to obtain the deflection, deformation and moments of the factory steel portal frame. The calculation of a factory steel portal frame can be done easily by manual calculation. However, a more complicated factory steel portal frame requires the help of software. Otherwise, it would be too time consuming to analyse the factory steel portal frame by manual calculation.

CivilFEM for ANSYS is an advanced, comprehensive and notable finite element analysis and design software that is suitable for civil engineering related projects. Apart from the software ANSYS, there are other software such as STAAD PRO, TEKLA, SAP 2000 and many more which can be used for civil engineering related projects.

1.2 Problem Statement

In modern construction, steel structure is used for almost all type of structure such as heavy industrial buildings, single-storey buildings and many more. Steel portal frame is a metal structure which is made of structural steel components connected with each other to carry loads and provide rigidity. There are several methods that can be used to analyse a factory steel portal frame. However, in order to make the procedure easier, the finite element method is used through ANSYS software.

Before construction process, it is necessary to make sure the model passes the designing phase by using the software ANSYS. In this research, the deformation, deflection and moments of the model will have to be determined from the software ANSYS. The model will also have to pass the code checking according to Eurocode 3.

1.3 Objective

Research objectives play an important role for every project in order for the research to be conducted well. It serves as a guideline for researchers to follow and achieve the final results required. The objectives of this research are :-

- i. To determine the behavior of factory steel portal frame.
- ii. To determine the factory steel portal frame passes all the code checking.

1.4 Scope of Study

The software ANSYS will be used to analyse this research of factory steel portal frame. Modeling of the design will be done by using ANSYS. The uniformly distributed load will be assumed as point loads as the load will be transferred to the nodes as point loads. The point loads include permanent actions and variable actions. However, wind load will be applied to one side of the model. The wind load will be applied on the main structure. The main steel work of the structure is the portal frame while the secondary steel works of the structure includes purlins, bracings and side rails. The deformation, deflection and code checking will be assessed.

1.5 Expected Outcome

This research claims to find out the behaviors and passing of code checking of factory portal frame. The behaviors are deformation, deflection, tension checking, compression checking and lateral torsional buckling checking according to Eurocode 3.

1.6 Significance of Study

This research will provide information regarding the steps and results of analyzing a factory steel portal frame by using ANSYS. The maximum deformation, deflection and moment of the structure can be determined. It is important to do analysis on the structure before constructing it to ensure the structure is safe against failure. Besides, it also helps us to save cost and time in terms of designing and selecting suitable dimension of material to be used for construction. Thus, it is important to learn on how to design steel portal frame in Malaysia as it is being practiced widely by developed countries in building single-storey buildings. With this skill, it will improve the development of Malaysia.
