

THE ENHANCED MODEL OF
HYPERLEDGER COMPOSER SUPPLY CHAIN
(HCSC) FOR THE PRODUCT
ENVIRONMENTAL IN SUPPLY CHAIN
NETWORKS

ARWA MUKHTAR MAKKI KANANI

DOCTOR OF PHILOSOPHY

UNIVERSITI MALAYSIA PAHANG

SUPERVISOR'S DECLARATION

We hereby declare that We have checked this thesis and in our opinion, this thesis is adequate in terms of scope and quality for the award of the degree of Doctor of Philosophy.

(Supervisor's Signature)

Full Name : Dr. Awanis Romli
Position : Senior Lecturer
Date : 25/11/2021

(Co-supervisor's Signature)

Full Name : Dr. Noorhuzaimi@Karimah Mohd Noor
Position : Lecturer
Date : 25/11/2021

STUDENT'S DECLARATION

I hereby declare that the work in this thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at Universiti Malaysia Pahang or any other institutions.

A handwritten signature in blue ink, appearing to be 'Arwa', is positioned above a horizontal line.

(Student's Signature)

Full Name : ARWA MUKHTAR MAKKI KANANI

ID Number : P05342467

Date : 25/11/2021

ARWA MUKHTAR MAKKI KANANI

Thesis submitted in fulfillment of the requirements
for the award of the degree of
Doctor of Philosophy

Faculty of Computing
UNIVERSITI MALAYSIA PAHANG

AUGUST 2022

ACKNOWLEDGEMENTS

First of all, I would like to acknowledge Faculty of Computing, College of Computing and Applied Sciences at Universiti Malaysia Pahang (UMP). Thanks for supporting research and providing the necessary tools and facilities for researchers to complete their research studies smoothly.

Sincere thanks and deepest gratitude goes to my supervisor Associate Professor Ts. Dr. Awanis Romli. I sincerely appreciate all the support I got from her during my PhD years. Her generous assistance, encouragement, advice, and knowledge sharing are very much appreciated. I would like to thank her for helping me out to sort participation to attend a Blockchain world class event “Future Blockchain Summit”. Wherein, I was lucky to grab this opportunity, discuss with Blockchain experts, and gain solid Blockchain knowledge experience. My especially deepest gratitude extends to Dr. Mansoor Abdullatif Abdulgaber who constantly assisted, motivated, and always being there to motivate, encourage and advice. His time and efforts were great contributors to this thesis success. My deepest gratitude also goes to Dr. Hasan Kahtan for not hesitating in sharing knowledge and guidance. Great motivation times we spent with him during motivation sessions. My deepest gratitude also goes to Dr. Hael Al-bashiri and Dr. Fadhl Mohammad for his useful insights and comments especially in improving thesis writing skills. I would like also to thank my friends and colleagues, and lab mates for the valuable shares, comments, and advices during my time at UMP.

The completion of this journey would not be easy without the unconditional support from my family. My father Mukhtar Makki, my mother Suaad Mahmood, my sister Sohail and brothers Mazin, Wail, and Makki thank you for all the emotional and financial support.

Finally, this effort is a gift for my beloved kids Abdulrahman, Dania, Tasneem, and Mohamed (Haboab) who inspiring me to pursue the success along the journey.

ABSTRAK

Teknologi Blockchain telah mendapat perhatian yang semakin meluas sejak beberapa tahun ini. Akhir-akhir ini, banyak model berasaskan Blockchain telah dicadangkan untuk menambah baik isu ketelusan yang lemah dalam rantai bekalan. Walau bagaimanapun, disebabkan oleh pembangunan dan kerumitan operasi rantai bekalan dalam beberapa tahun kebelakangan ini, ketelusan yang lemah masih menjadi salah satu cabaran utama yang merendahkan prestasi rantai bekalan. Model Blockchain yang sedia ada mempunyai Batasan yang utama dalam sifat ukuran keterlihatan biasa (VMP): perkongsian maklumat, kebolehesanan dan keterlihatan inventori seperti kekurangan mengenal pasti sifat persekitaran produk untuk mengenal pasti produk hijau. Masih terdapat keadaan untuk membuang masa dalam sistem kebolehesanan semasa. Model yang sedia ada ini hanya berkongsi maklumat inventori asas iaitu tahap inventori, ramalan permintaan. Model HCSC ialah salah satu model berasaskan Blockchain yang penting menangani perkongsian maklumat dan kebolehesanan, walau bagaimanapun, terdapat kekurangan mengenal pasti sifat persekitaran produk untuk mengenal pasti produk hijau. Kekurangan masa untuk pengesanan kelompok produk suhu penyimpanan dan produk tamat tempoh. Kurang keterlihatan inventori dengan kos inventori yang lebih rendah dengan memodelkan stok keselamatan dan titik pesanan semula. Kajian ini mencadangkan model Stok Pesanan Produk Rantai Bekalan Hyperledger (HCSC-POS) berdasarkan model HCSC yang dianggap untuk berkongsi produk kelestarian alam sekitar dalam rangkaian Blockchain untuk mengenal pasti produk hijau agar dapat mengawal kesan alam sekitar daripada pengeluaran dan meningkatkan kemampuan alam sekitar. Model yang dicadangkan dapat meningkatkan kebolehesanan proses pengesanan kelompok bagi suhu produk penyimpanan suhu dan produk tamat tempoh, dan memanggil semula pesanan yang rosak dengan pantas untuk mengurangkan penggunaan masa dalam penarikan semula produk. Tambahan pula, keterlihatan inventori dengan kos inventori yang lebih rendah dengan memodelkan stok keselamatan dan titik pesanan semula. Pembangunan model yang dicadangkan terdiri daripada tiga langkah utama: 1-Memperluaskan model data HCSC, 2- Membangunkan peningkatan dalam rangka kerja Komposer Hyperledger Blockchain, dan 3-Menguji peningkatan yang dicadangkan dalam persekitaran masa jalan pelaksanaan Hyperledger Composer. Untuk menilai model yang dicadangkan, skenario ujian eksperimen dijalankan untuk menilai kebolehesanan dan peningkatan keterlihatan inventori dari segi keberkesanan dan kecekapan masa menggunakan data industri sebenar daripada industri pembuatan. Keputusan menunjukkan kebolehcapaian dan ketersediaan produk memberi kesan kelestarian alam sekitar dengan label "produk mesra alam" dalam rangkaian blockchain. Model ini meningkatkan kebolehesanan kelompok dengan penggunaan masa yang lebih sedikit dengan purata 89.47% lebih baik daripada model sedia ada lain dalam respons masa. Dalam keterlihatan inventori, kecekapan model HCSC-POS dalam pengurangan kos inventori adalah 60.48 % lebih baik daripada model lain. Keputusan menunjukkan beberapa kelebihan daya saing industri rantai bekalan dari segi kemampuan alam sekitar, kebolehesanan kelompok yang cepat, dan peningkatan keterlihatan inventori dengan kos inventori yang lebih rendah dengan memodelkan stok keselamatan dan titik pesanan semula. Keterlihatan hujung ke hujung ini membantu dalam proses membuat keputusan perniagaan yang tepat dan meningkatkan prestasi rantai bekalan

ABSTRACT

Blockchain technology has received growing attention over the years. Recently, many blockchain-based models have been proposed to improve the issues of poor visibility in supply chains. However, due to the expansions and complexity in the operations of supply chains in the last few years, poor visibility is still one of the major challenges that lower the performance of supply chains. Besides, the existing blockchain models have key limitations in the common visibility measurements properties (VMP): information sharing, traceability, and inventory visibility such as a lack of identifying products based on environmental attributes to identify the green products. Still, there is a need to eliminate the time consumption in the current traceability systems. Current models share basic inventory information including inventory level and demand forecasts. Model HCSC is one of the important blockchain-based models that addressed information sharing and traceability; however, it lacks a feature of identifying product environmental attributes to know the green products, lacks a fast batch tracking of product storage temperature and expired products, and lacks visibility of inventory with less inventory cost by modelling safety stock and reorder points. Thus, this study proposes a Hyperledger composer supply chain products orders Stock (HCSC-POS) model based on the HCSC model to share product environmental sustainability attributes to the blockchain network in the identification of green products to control the environmental impact of production and improve the environmental sustainability. The proposed model enhances traceability by fast batch tracking of the product storage temperature and expired products for fast identification and recalling defective orders to reduce time consumption in product recalls. Additionally, it enhances the visibility of inventory with less cost by modelling safety stock and reorder points. The development of the proposed model consists of three main steps: 1-Extending the HCSC data model, 2- Developing the enhancements of the Blockchain Hyperledger Composer framework, and 3-Testing the proposed enhancements in the Hyperledger Composer execution runtime environment. To evaluate the proposed model, experimental test scenarios were conducted to evaluate traceability and inventory visibility enhancements in terms of time effectiveness and efficiency using real industry data from the manufacturing industry. The results show accessibility and availability of product environmental sustainability attributes with “environmentally friendly product” labels in the blockchain network. The model enhances the traceability of batches with less consumption time of about 89.47% better than other existing models in time responsiveness. In the inventory visibility, model HCSC-POS efficiency in terms of inventory costs showed about 60.48% reduction which was better than other models. These results offer the supply chain industry a competitive advantage in terms of environmental sustainability, fast batch traceability, and increased inventory visibility with less inventory cost by modelling safety stock and reorder points. This end-to-end visibility helps in the accurate business decision-making process and improves supply chain performance.
