(Nama Penyelia)

Tarikh: **22 JUN 2012**

Tarikh: **22 JUN 2012**

CATATAN: * Potong yang tidak berkenaan.

** Jika tesis ini SULIT atau TERHAD, sila lampirkan surat daripada pihak berkuasa/organisasi berkenaan dengan menyatakan sekali tempoh tesis ini perlu dikelaskan sebagai SULIT atau TERHAD.

♦ Tesis dimaksudkan sebagai tesis bagi Ijazah Doktor Falsafah dan Sarjana secara Penyelidikan, atau disertasi bagi pengajian secara kerja kursus dan penyelidikan, atau Laporan Projek Sarjana Muda (PSM).

SUPERVISOR'S DECLARATION

We hereby declare that we have checked this project and in our opinion, this project is adequate in terms of scope and quality for the award of the degree of Bachelor of Mechanical Engineering.

Signature :
Name of Supervisor : IDRIS BIN MAT SAHAT
Position : LECTURER
Date : 22 JUNE 2012

Signature :
Name of Panel : PROF. DR. ABDUL GHAFAR ABDUL RAHMAN
Position : LECTURER
Date : 22 JUNE 2012

STUDENT'S DECLARATION

I hereby declare that the work in this project is my own except for quotations and summaries which have been duly acknowledged. The project has not been accepted for any degree and is not concurrently submitted for award of other degree.

Signature :

Name : NUR DIYANA WAHIDA BINTI ADAM

ID Number : MA08065

Date :

Dedicated to my parents

Adam Bin Abdullah

Noor HasidaBinti Din

ACKNOWLEDGEMENTS

All praises be to Allah, Lord of the Universe, the Merciful and Beneficent to Prophet Muhammad S.A.W, His Companion and the people who follow His path, without his blessings, I would not be able to accomplish this report in the given time.

First and foremost, I would like to record my deep appreciation to my supervisor, MrIdris Bin Mat Sahat for his administration, invaluable guidance, continuous encouragement and constructive criticisms in making this project achievable. I am very thankful for his consistent support from the first day I applied to graduate program to these concluding moments. He is always there when I want to ask opinion and suggestion at difficult time.

In addition, special thanks go to all staff of the Mechanical engineering department, UMP, who helped me in many ways and made me stay in UMP pleasant and unforgettable. Thanks also go to my friends who are under same supervisor. I would like to acknowledge their comments and suggestion which were crucial for the successful completion of this study.

Finally, I acknowledge my sincere indebtedness and gratitude to my parents Adam Bin Abdullah and Noor Hasida Binti Din for their love and sacrificed throughout my life. They are always be there when I need them at difficult time. Wihout them, I will not be able to came in this world succesful in my study. I offer my regards and blessings to all of those who I had mention above. Thank you once again.

ABSTRACT

Thermodynamic properties calculator is an engineering tool built by MS Excel add-in which is crucial used due to calculate thermodynamics properties of water, air and superheated vapor. The main purpose of this project is to develop an excel file that can simply obtain thermodynamic properties without manually reading from thermodynamic properties table. The project scopes were fluids that will be used as a reference were water, superheated vapor and air, thermodynamic properties such as enthalpy, entropy, specific heat, thermal conductivity, specific volume, relative pressure ratio, specific volume ratio and internal energy were the main properties that need to be referred. All the properties were based on thermodynamic properties table and result validation. Formulas that suitable to the formula of interface created using excel file were identified and studied. All unknown for the common formula that used to do interpolation manually were listed out and identified its function. Then, formula for each unknown created using excel formula and lastly all the formulas created for each unknown were combined according to the common formula used for manual interpolation. The new formula created using excel formulas was tested and evaluated. The value of properties from the interface created was compared to the value of properties from manual interpolation using calculator in order to check the validation of the data. In the nutshell, interface of a simplest way to read thermodynamics properties table using excel software was successfully created and was checked by data validation. In order to improve this project, the function of changing the units of thermodynamics properties to other standard, for example into American Standard, should be developed and the software should also be able to run on other operating systems such as MAC for Apple and LINUX for Linus Torvalds so that people using other operating systems will have the benefits of using the software.

ABSTRAK

Termodinamik Kalkulator adalah salah satu alat kejuruteraan penting yang dibina oleh MS Excel add-in yang digunakan untuk mengira sifat termodinamik air, udara dan panas lampau wap. Tujuan utama projek ini adalah untuk menyediakan satu sistem menggunakan fail excel yang boleh mendapatkan sifat-sifat termodinamik dengan cara yang mudah tanpa membaca daripada jadual termodinamik secara manual. Skop projek ini adalah cecair yang akan digunakan sebagai rujukan adalah air, udara, wap panas lampau dan sifat-sifat termodinamik seperti entalpi, entropi, haba tentu, kekonduksian terma, isipadu tentu, nisbah tekanan relatif, nisbah isipadu tentu dan tenaga dalaman yang perlu dirujuk. Semua sifat termodinamik yang dirujuk adalah berdasarkan jadual termodinamik dan pengesahan data dikaji. Semua formula yang sesuai untuk formula sistem yang dicipta menggunakan fail excel dikenal pasti dan dikaji. Semua nilai yang tidak diketahui untuk formula yang biasa digunakan secara manual disenaraikan dan dinyatakan fungsinya. Formula untuk setiap nilai tidak diketahui dicipta menggunakan fail excel dan akhir sekali semua formula itu digabungkan dengan berpandukan formula umum yang digunakan untuk interpolasi manual. Formula baru yang dicipta menggunakan formula excel diuji dan dinilai. Nilai daripada sistem yang dicipta di bandingkan dengan nilai daripada interpolasi manual menggunakan kalkulator untuk memastikan pengesahan data. Kesimpulannya, sistem mudah untuk membaca jadual termodinamik dicipta dengan jayanya dan disemak dengan pengesahan data. Untuk memajukan lagi sistem ini, Fungsi menukar unit termodinamik sifat kepada standard yang lain, contohnya ke American Standard, perlu dibangunkan dan perisian ini juga boleh berfungsi di dalam sistem operasi lain seperti MAC untuk Apple dan LINUX untuk Linus Torvalds supaya orang yang menggunakan sistem operasi lain akan mempunyai manfaat menggunakan perisian ini.

CHAPTER 1

INTRODUCTION

1.1 PROJECT BACKGROUND

Reading thermodynamic properties from the properties table is very confusing especially when time is insufficient. Sometimes, an addition of time is needed when the value of parameter is not in the table, and it needs interpolation. By using the interpolation technique, the calculations are prone to human error. The aim of this project is to give the simplest way and exact values for users in solving their problems which involve thermodynamic properties table by using excel. Computer calculation of thermodynamic properties is an efficient replacement for text property tables, which are still used in thermodynamic instruction. Computerized property calculations are used routinely in engineering application.

In this project, an excel file will be created where the thermodynamic properties can be easily obtained simply by filling in the value of temperature in a certain cells. The thermodynamic properties will appear automatically in the designated cells as a result. Less time will be needed to read the thermodynamic properties table and no interpolation is needed as it is done by computer. This project is described here as an interface thermodynamic calculation based on data and computational procedures. The program was designed to provide easy-to-use thermodynamic properties tables within excel, which is widely available on personal and office computer.

A simple transition from the interface to cell formulas provides a wide range of application from simple calculations of a single state to detail of thermodynamic

properties table using cell formulas. Formulas in excel such as LOOKUP, MATCH, SEARCH, FIND, INDEX, DROPDOWNLIST and many other will be utilized to obtain the properties in the process. The thermodynamic properties is based on thermodynamic properties table. Samples of calculations will help in validating result from excel file with manual calculation.

1.2 PROBLEM STATEMENT

In this modern era, technology plays a vital role in decision making, communicating, and referring in a short time. Manual calculation can cause human error in side of calculation such as parallax error, key in the wrong value during calculation, and it also will takes long time to get the result. Furthermore, it will cause a difficulty to read the thermodynamics table and to do the interpolation manually when it comes to a rushing situation. Thus, this interpolation of thermodynamic properties table using excel file save a lot of time and hopefully the calculation will result error free.

1.3 PROJECT OBJECTIVE

The main objective of this project is to develop an excel file to simply obtain thermodynamic properties without manually reading from thermodynamic properties table.

1.4 SCOPE OF THE PROJECT

The scopes of this project are limited to:

- a) Fluids that will be used as a reference are water, superheated vapor and air.
- b) Thermodynamic properties such as enthalpy, entropy, specific heat, thermal conductivity, specific volume, relative pressure ratio, specific volume ratio and internal energy are the main properties that are to be referred.
- c) All the properties are based on thermodynamic properties table.
- d) Result validation.

CHAPTER 2

LITEATURE REVIEW

2.1 INTRODUCTION

In this chapter it will discuss about the history of Microsoft Excel and also history of Thermodynamic Properties Table such as chronology of Excel and Thermodynamic Properties Table and the author of both of them.

2.2 HISTORY OF EXCEL

2.2.1 Spreadsheet

A simple definition of spreadsheet is a document that stores data in a grid of vertical columns and horizontal rows. Columns are typically labeled with letters (a, b, c, etc) while rows are labeled using numbers (1, 2, 3, etc.). Individual row/column locations, such as A1 or B2, are referred to as cells. Each cell can each store a unique instance of data. Information can be stored in a more structured way than using plain text by entering the data into a single spreadsheet. The row/column structure also allows the data to be analyzed using formulas and calculations. Spreadsheets are in widespread use throughout the world for engineering design.

Spreadsheets are more streamlined than databases and are particularly useful for processing numbers. This is why spreadsheets are commonly used in scientific, financial and engineering applications. Although there has been some interest in the accuracy of business and financial spreadsheets, it seems to have escaped the disciplines that have traditionally been applied to engineering design and to computer

programming. (Panko, 1998) For a range of engineering calculations, there are now a number of specialized texts on spreadsheets written for engineers and specialized applications of spreadsheets are being developed and reported.(Morison,2000)

Furthermore, spreadsheet application is one of the computer programs that allow users in creating and manipulating spreadsheets electronically. In the spreadsheet applications, each value sits in each cell. The type of data can be defined in each cell and how different cells depend on one another. Formulas mean the relationships between cells, and the names of the cells are called labels. Once the cells have been defined and the formulas for connecting them together created, the data can be entered. Then, the selected values can be modified to see how all the other values change accordingly. This enables you to study the various what-if scenarios.

In addition, a spreadsheet can be used to store bank account data, including balance and interest information. A column that stored by the account balances of several clients can be easily summed to produce the total value of all the clients' balances. These amounts can then be multiplied by the interest rate from another cell to see the value of the accounts will be in a year. Once the formula has been created, by modifying the value of interest only, the rate cell will also change the projected value of all the accounts. They are also widely used by others to support decision making, including use by professionals and all levels of management up to, and including, very senior management.(Cragg,1993)

There are many softwares that use spreadsheet such as MATLAB, MICROSOFT ACCESS, MICROSOFT EXCEL and others. All the softwares mentioned before have their own advantages and disadvantages.

SOFTWARE	DEFINITION	ADVANTAGES	DISADVANTAGES
Matlab	MATLAB is an interactive system whose basic data element is an array that does not require dimensioning.	It is an interpreted language for numerical computation which allows one to perform numerical calculations, and visualize the results without the need for complicated and time consuming programming.	It is an interpreted language and therefore can execute more slowly than compiled languages.
Microsoft Access	Microsoft Access is a database software program that makes manipulating data manageable for users of many skill levels.	Microsoft made it easy for just about anyone to learn how to work with databases by replacing some of the complicated work with easy-to-use templates.	Access is more useful for individual departments or small and medium business sectors and also has difficulty dealing with databases larger than 2GB in size.
Microsoft Excel	Microsoft Excel can best be described as a full-featured spreadsheet for Windows from Microsoft which is a component of its Office product group for business applications.	Microsoft Excel is easy to understand, create column names, enter your data, create formulas, and you're on your way.	When you develop your application into one file it can be huge and will make your program execution very slow.

Table 2.1: Spreadsheet softwares

Source: CCNY Software Training Center.

2.2.2 Chronology of Excel

Chronology of Excel begins with Visible Calculator followed by Lotus 1-2-3 and lastly it comes to Microsoft Excel itself.

2.2.3 Visible Calculator

The screenshot shows a spreadsheet window titled 'C11 (L) TOTAL' with a green title bar. The spreadsheet has four columns: A (ITEM), B (NO.), C (UNIT), and D (COST). The data is as follows:

A	B	C	D
ITEM	NO.	UNIT	COST
MUCK RAKE	4	12.99	51.96
BUSH CUT	1	100.00	100.00
TONER	25	48.00	1200.00
EYE SNUFF	4	9.99	39.96
SUBTOTAL			1315.92
9.75% TAX			128.22
TOTAL			1443.16

Figure 2.1: Visible Calculator

Source: Creative Computing, VisiCalc '79

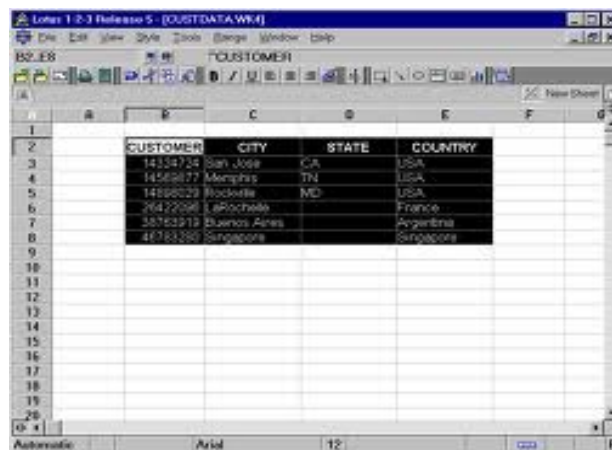

In 1961, the development of computerized spreadsheets in business accounting applications was pioneered by Professor Richard Mattessich. Bricklin had programmed the first working prototype of his concept in integer basic in 1978 with his brilliant idea. The purpose of this program was to help users input and manipulate a matrix of five columns and 20 rows. Bricklin calls Frankston the "co-creator" of the electronic spreadsheet to improve and expand the program because the first version was not very powerful. After a while, Frankston had improved the program by creating the production code with faster speed, better arithmetic, and scrolling. (Dan Bricklin, 1984)

Daniel Bricklin, a master student in business administration at Harvard Business School came up with the idea for an interactive visible calculator in 1978. Bob Frankston joined him to help in writing the programme for his new electronic spreadsheet. The idea behind VisiCalc was developed by Dan Bricklin, and the

actual programming was performed by his friend, Bob Frankston. Bricklin and Bob Frankston then invented and created the software program VisiCalc together and at last both of them started their own company, Software Arts Inc., to develop their product. The name "VisiCalc" is a compressed form from "visible calculator" and it was the first "killer" application for personal computers at that time. (Dan Bricklin, 1984)

VisiCalc introduced a new level in application software compared to the early microprocessor computers had been quickly supported by BASIC and a few games. It was considered a fourth generation software program. Companies invested time and money in doing financial projections with manually calculated spreadsheets faced a problem such as recalculating every single cell in the sheet is needed if a single number in a cell is change. By using VisiCalc, you could change any cell, and the entire sheet would be automatically recalculated. (Dan Bricklin, 1984)

2.2.4 Lotus 1-2-3

The image shows a screenshot of the Lotus 1-2-3 spreadsheet application. The window title is "Lotus 1-2-3 Release 5 - [CUSTDATA.WK4]". The menu bar includes File, Edit, View, Style, Tools, Range, Window, and Help. The toolbar contains various icons for file operations and editing. The spreadsheet grid shows a table with the following data:

	CUSTOMER	CITY	STATE	COUNTRY
3	14134734	San Jose	CA	USA
4	14568877	Memphis	TN	USA
5	14188029	Rockville	MD	USA
6	29422098	La Rochelle		France
7	33783919	Buenos Aires		Argentina
8	44783390	Singapore		Singapore

The status bar at the bottom shows "Automatic", "Arial", "12", and "F8".

Figure 2.2: Lotus 1-2-3

Source: Lotus 1-2-3 version 1.0

Lotus 1-2-3 was developed by Mitch Kapoor and it is a new industry spreadsheet standard. Lotus' first product was presentation software for the Apple II known as Lotus Executive Briefing System. The name of Lotus 1-2-3

referred to the three ways the product could be used, as a spreadsheet, graphics package, and database manager. This Lotus 1-2-3 software made it easier to use spreadsheets and it added integrated charting, plotting and database capabilities. It was established spreadsheet software as a major data presentation package as well as a complex calculation tool. It was also the first spreadsheet vendor to introduce cell ranges, naming cells, and spreadsheet macros. (Henderson, 1983)

Lotus 1-2-3 will eventually be converted to other microcomputers that use the Intel 8086 or 8088 microprocessor and soon will be available for the IBM Personal Computer (PC). The initial version of 1-2-3 have 128K bytes of memory, an IBM PC with two disk drives, and either a monochrome or a color display. If the computer has both monochrome and color display, it can give the view of spreadsheet on the monochrome monitor and graphs on the color monitor at the same time. If there only the monochrome video display, it cannot give the view the graphs but can only print them out. It is different if there only the color video display, it provide two alternate ways between viewing the spreadsheet and the graph. (Henderson, 1983)

2.2.5 Microsoft Excel

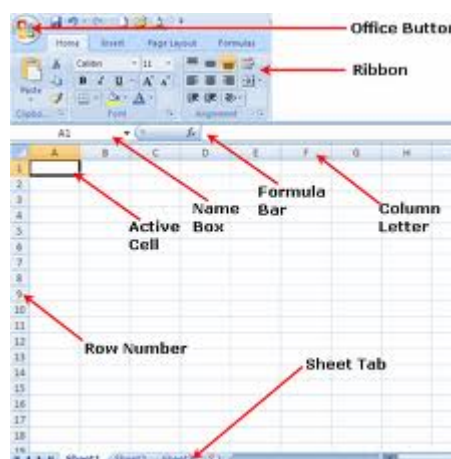

Figure 2.3:Microsoft Excel

Source: Microsoft Excel 97 developer's handbook

The next and latest the milestone was Microsoft Excel spreadsheet. In 1984-1985, Excel was originally written for the 512K Apple Macintosh. Excel was one of the first spreadsheets that use a graphical interface with pull down menus and a click capability using a mouse pointing device. The Excel spreadsheet with a graphical user interface was easier for most people to use compared to the command line interface of PC-DOS spreadsheet products. Many people bought Apple Macintoshes so that they could try and use Excel spreadsheet program that created by Bill Gates. In the past few decades, Excel has grown rapidly and offers so many different features and applications for users. From their earliest, simple spreadsheets to the wonderful program nowadays, there have been many changes improvement in the overall format of the program. But being honestly and truthly, the essence of the software is still the same. In fact, Excel of today still uses the same program, called VisiCalc, which displays the cells of the sheet, organized into neat columns and rows just like in the very first version. This program almost the same like before that also allows users to input information into the cells, such as numbers, and reference them to other cells in the spreadsheet. (Power,2010)

Microsoft Excel was actually the first spreadsheet program that allowed users to change up the overall look of the spreadsheet, such as the font, width, length and cell appearance. It was also the first program to give users an intelligent cell computation, which meant that users could total a number of cells together in one specific cell with a simple formula. This made the program different from the previous version and invaluable to users, especially in the financial industry. Microsoft Excel was developed and manufactured by Microsoft Corporation that allows the users in organizing, formatting, and calculating data with formulas using a spreadsheet system divided by columns and rows. It usually comes with the bundle of Microsoft Office and is compatible with other applications that offered in the suite of products like Power Point. In 1987, Microsoft documents show the launch of Excel 2.0 for MS-DOS version 3.0. When Microsoft was launched the Windows operating system in 1987, Excel was one of the first application products that released for it. Overall, Microsoft has done transformation over the years to become one of the leading spreadsheet software programs in the world and have

millions of users rely on this in both their business and personal lives to keep organized. (Power, 2010)

Version	Released	Comments
1	1985	In 1984-1985, Excel was originally written for the 512K Apple Macintosh.
2	1987	The first Windows version included a run-time version of Windows.
3	1990	Improvement of new features like toolbars, drawing capabilities, outlining, add-in support, 3D charts, and many more.
4	1992	Improvement which included lots of usability features.
5	1993	A major upgrade which included multi-sheet workbooks and it can support for Visual Basic For Application (VBA) program.
7	1995	Feature-wise which is very similar to Excel Version 5 and it is the first major 32-bit version of Excel.
8	1997	A major improvement with a new interface for VBA developers, UserForms, data validation, and many more.
9	1999	It can use HTML as a native file format, "self-repair" capability, enhanced clipboard, pivot charts, modeless user forms.
10	2001	It has a many new features in this version. The most significant feature is it has the ability to recover your work when Excel get crashes.
11	2003	This version consist of many new features. The most significant feature is it improved support for XML.
12	2007	A lot of improvements and upgrades have been done. It allows users enjoy fewer mouse clicks and better efficiency.
14	2010	Builds on Excel 2007 and is due to arrive in the first half of 2010. New features include sparkline graphics, pivot table slicers, an updated Solver, and a 64-bit version.

2.3 HISTORY OF THERMODYNAMIC PROPERTIES TABLE

In the early part of this century, data were presented in the form of thermodynamic charts and tables. Since steam emerged as the working fluid in mechanical and electric power generation, the data taking, collecting, graphing and formulating of properties of water and steam has been an ongoing effort. Traditionally, the needs of the power engineers for property values of water and steam were called as Skeleton Tables. These were tables of pressure, enthalpy and volume for the saturated vapor and liquid and of specific enthalpy and specific volume on a coarse grid of temperature-pressure points in the one-phase regions, sufficiently closely spaced that only linear interpolations are adequate (Sato, 1991)

An agreement was reached on the first International Skeleton Steam Tables in 1934. A substantial effort to expand and improve the experimental data base for steam was already under way, most notably by Osborne and coworkers at NBS, the National Bureau of Standards, presently NIST, the National Institute of Standards and Technology, in the U.S.A. A collection of data and tables for thermodynamic properties of water and steam was part of a comprehensive study by Dorsey in 1940. The acquisition, evaluation and correlation of steam properties gained new impetus in several countries after the Second World War. The International Skeleton Tables of the Thermodynamic Properties of Water Substance, 1963, were adopted at the Sixth International Conference on the Properties of Steam (ICPS) in New York, 1963. (Sato, 1991)

International Association for the Properties of Steam (IAPS) was established as a standing organization for the international cooperation on the properties of steam shortly after the 1968 Conference. The task of collecting and updating the experimental data on thermodynamic properties of ordinary water and steam is the beginning of IAPS. The purpose of this task was because there were many new high-quality experimental data had been obtained in much wider ranges of temperature and pressure since 1963. There have been many efforts done to extend and improve the formulation in order to obtain more precise formulations in more limited regions

and to produce the more accurate Skeleton Tables that are currently accepted by IAPWS since 1984. (Sato, 1991)

International Association for the Properties of Water and Steam (IAPWS) adopted a new formulation called “The IAPWS Formulation 1995 for the Thermodynamic Properties of Ordinary Water Substance for General and Scientific Use” in 1995 (IAPWS-95 formulation or IAPWS-95) for short. This work provides information on the selected experimental data of the thermodynamic properties of water used to develop the new formulation, but information is also given on newer data. (Wagner, 2002) This formulation is the current international standard for thermodynamic properties of water, and is implemented in NIST Standard Reference Database 10. These properties are tabulated along the vapor-liquid saturation curve as a function of temperature and pressure. (Harvey, 1995)

The formulation provided in this release is recommended for industrial use, and is called “IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam”, (IAPWS-IF97). The IAPWS-IF97 replaces the previous industrial formulation “The 1967 IFC-Formulation for Industrial Use” (IFC-67). (Dr. R. Fernandez-Prini, 1997) It is a set of equations that designed to give accuracy on the thermodynamic properties of liquid and gas with short computing times. The equations have been fitted to properties calculated from IAPWS-95 and it covers a smaller range of states than IAPWS-95 and this smaller range is divided into sub-regions in order to achieve fast computing times. For particular region, some of these regions have backward equations with different independent variables from the basic equation. (Watanabe, 2004)

2.4 EXISTING SOFTWARE FOR THERMODYNAMIC PROPERTIES TABLE

There is lots of software for thermodynamic properties table in the market. All these software have its own criteria. Software that will be shared are ChemicalLogicSteamTab Companion and Steam97.

2.4.1 ChemicalLogicSteamTab Companion

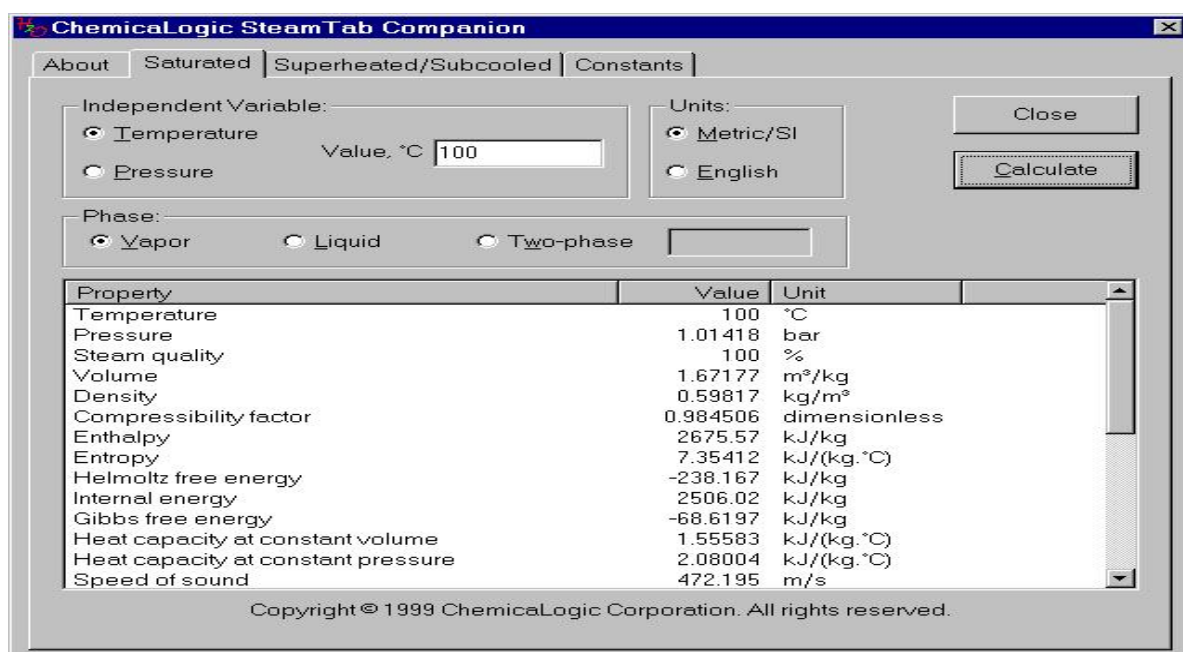

Figure 2.5: ChemicalLogicSteamTab Companion

Source: ChemicalLogic Corporation

ChemicalLogicSteamTab Companion is developed by ChemicalLogic Corporation. The source of this software is based on International standard IAPWS-95 formulation called ‘‘The IAPWS Formulation 1995 for the Thermodynamic Properties of Ordinary Water Substance for General and Scientific Use’’. Properties that are used in this software are water and steam.

2.4.2 Steam 97

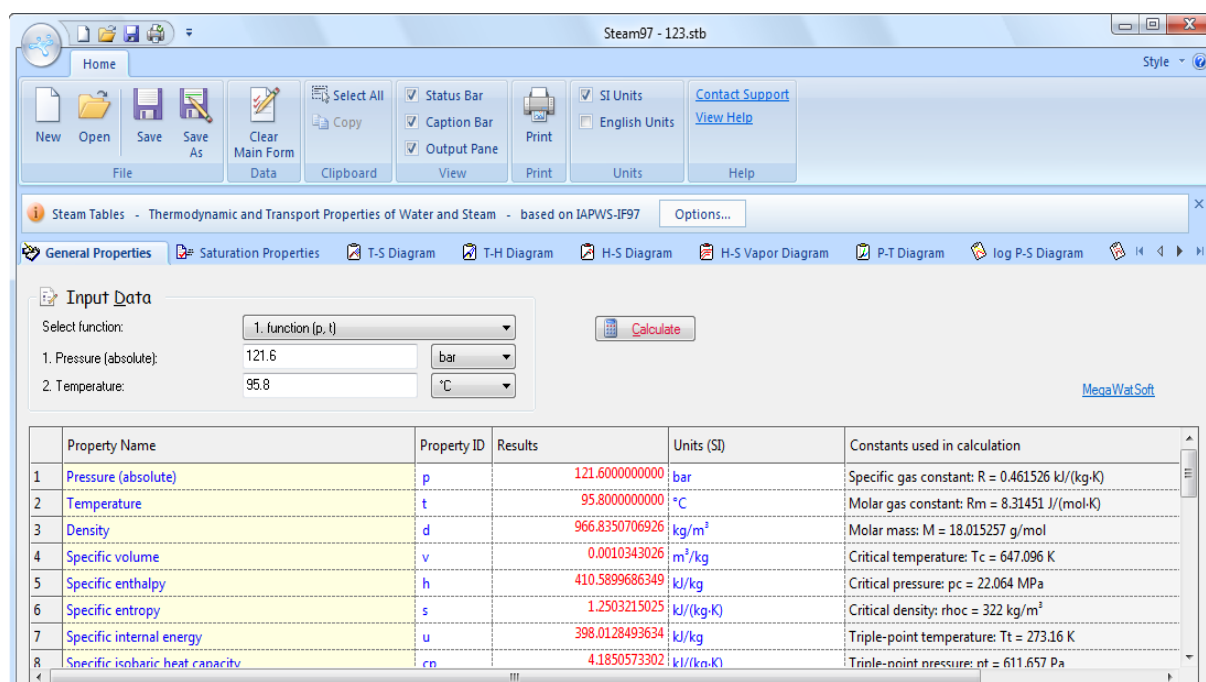

Figure 2.6: Steam97

Source: Mega WatSoft Inc.

Steam 97 is developed by Mega WatSoft Inc. the source of this software is based on Industrial Formulation for Steam tables, called "*IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam (IAPWS-IF97)*". Property that is used is only steam.

CHAPTER 3

METHODOLOGY

3.1 INTRODUCTION

This chapter introduces the method of creating interpolation formula of Thermodynamics Properties Table by using Excel File. It shows step by step process that will be done during this project. This project is being done to find a simplification of reading Thermodynamics Properties Table using Microsoft Excel. During the experiment, we will do two different Excel Files that the first one is we will do the Excel File of Thermodynamics Properties Table that using the exact match type formula which mean no interpolation needed just to get the value that exactly in the table. The second is we will do the Excel File of Thermodynamics Properties Table that using the greater or less than match type formula in order to do the interpolation process to get the value that is not in the table. The flow chart in Figure 3.1 shows the overall flow of project in step by step process.

3.2 FLOW CHART

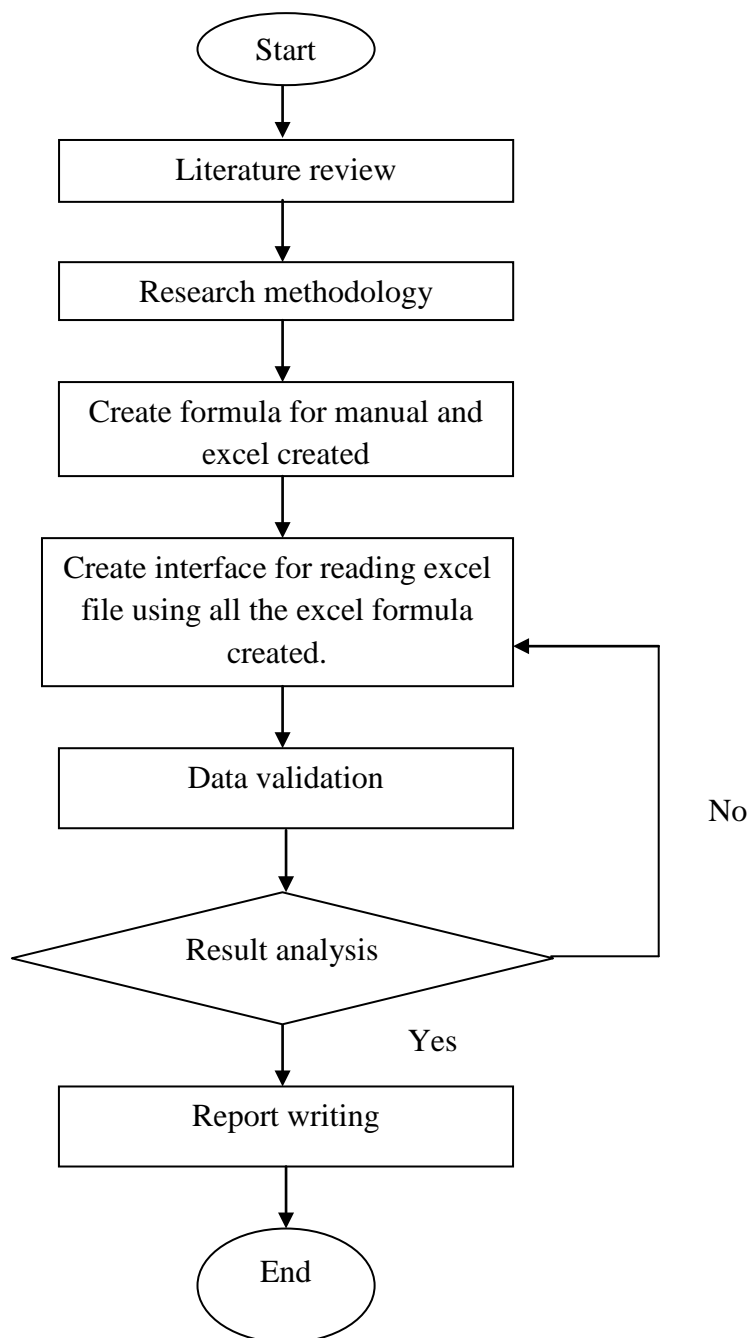

Figure 3.1: Flow Chart

This flow chart shows all the processes done in completing my final year project. I used this flow chat as a guide and reference to make sure my work completed in orderly.

3.3 Research methodology

3.3.1 Index Formula

Index formula is a formula in Excel that allows an extracting of the information in a cell by providing a larger location and pair of co-ordinates which mean row and column. It will return the value that is in the cell at the intersection of the row and column that have been specified. The full formula is “INDEX (array,row_num,column_num)” and the simplest translation of the formula is INDEX (range of the table referred, the row number of the table that the data is in, the column number of the table that the data is in). Figure 3.2 shows the example of index formula used in the excel software.

AVERAGE					
	A	B	C	D	E
1					
2	Temp.	Specific Heat			
3	T	Liquid	Vapor		
4	0.001	4217	1854		
5	5	4205	1857		
6	10	4194	1862		
7	15	4186	1863

14	INDEX(array; row_num; [column_num])				
15	INDEX(reference; row_num; [column_num]; [area_num])				
16	Lookup	Result			
17	10	4194			

Figure 3.2: Index Example

3.3.2 Match Formula

In Excel, Match formula searches for a value in an array and returns the relative position of that item. The formula for Match is `MATCH (lookup_value, lookup_array, match_type)`. Value is the value which we are trying to find in the array. It can be any number or a string. Array means a range of cells that contains the value that you are trying to match against. Match_type is optional parameter that specifies the type of match function will perform and operate. Figure 3.3 shows the match type and figure 3.4 shows the example of match formula used in the excel software.

	A	B	C	D	E	F	G	H	I	J
1										
2	Match Type	Explanation								
3	1	The MATCH function will find the largest value that is less than or equal to lookup_value. The array must be sorted in ascending order.								
4		If the match_type parameter is omitted, the Match function assumes as Match_type of 1.								
5	0	The Match function will find the first value that is exactly equal to lookup_value. The array can be in any order.								
6	-1	The Match function will find the smallest value that is greater than or equal to lookup_value. The array must be placed in descending order.								
7										

Figure 3.3: Match Types

17	10	Row 3				

Figure 3.4: Match Example

3.3.3 Indirect

In Excel, Indirect function returns the reference specified by a text string. References are immediately evaluated to display their contents. INDIRECT is used when you want to change the reference to a cell within a formula without changing the formula itself. The formula for Indirect is `INDIRECT(ref_text,[a1])`. `Ref_text` is a reference to a cell that contains an A1-style reference, an R1C1-style reference, a name defined as a reference, or a reference to a cell as a text string. If this argument is TRUE, or omitted, the `ref_text` is A1 style. If the argument is FALSE, the `ref_text` is R1C1 style. If `ref_text` is not a valid cell reference, INDIRECT returns the #REF! error value. Figure 3.5 shows the example of indirect formula used in the excel software.

	AVERAGE			=INDIRECT("B"&\$A\$5)		
	A	B	C	D	E	F
1	Data	Data				
2	B2	45				
3	B3	1.333

11	INDIRECT(ref_text; [a1])					
12						
13	Lookup	Result				
14	5	62				

Figure 3.5: Indirect Example

3.3.4 Dropdown List

A drop down list gives you a set number of entries to choose from when entering data. To make data entry easier, or to limit entries to certain items that you define, you can create a drop-down list of valid entries that is compiled from cells elsewhere in the workbook. When you create a drop-down list for a cell, it displays an arrow in that cell. To enter information in that cell, click the arrow, and then click the entry that you want. Not only can this speed up data entry, but it can also prevent people from misspelling entries or even from entering the wrong data altogether. Figure 3.6 shows the example of dropdown list formula used in the excel software.

Temp.	Saturation Pressure
°C	kPa
T	Psat
5	Water
24	Water
380	Superheated Vapor
	Air

Figure 3.6: Drop down list Example

3.4 Interfaces

There are three different interfaces to be created which are water, air and superheated vapor. The method of creating interfaces of water and air are same but different in table referred because table of water properties is referred for water interface and for air interface, table of air properties will be referred. The method in creating interface of superheated vapor is same but table of superheated vapor properties will be referred and it needs twice interpolation.

3.5 Method of Finding Properties Values

There are two methods of finding properties values from the Thermodynamic Properties Table. First, directly refer to the table and we can get the result because the value of temperature given is listed in the table. Second, interpolation is needed because the value of temperature given is not listed in the table.

3.5.1 Value of Temperature Given Listed In the Table

Given Temperature: 10°C

Formula created using Excel formula:

=INDEX(INDIRECT(B5&"!A4:L79");MATCH(A5;INDIRECT(B5&"!A4:A79");0);3)

Table 3.1 shows interface of the exact value for water table at 10 °C of temperature.

Table 3.1: Interface of Exact Value At 10°C For Water Table

Temp.	Saturation Pressure	Enthalpy				Enthalpy		Specific Heat		Thermal Conductivity	
°C	kPa	kJ/kg				kJ/kg		Cp, J/kg.K		k, W/m.K	
T	Psat	Sat. liquid,hf	Evaporator ,hfg	Sat. vapor,hg	Sat. liquid,Sf	Evaporator ,Sfg	Sat. vapor,Sg	Liquid	Vapor	Liquid	Vapor
10	DaTa	42.022	2477.2	2519.2	0.1511	8.7488	8.8999	4194	1862	0.58	0.018

After the formula has been created using Excel formula, Formula Evaluation is needed in order to know whether the formula we have created is right or wrong. It is also important as a guide for us if we have created wrong formula. By this formula evaluation, we can know where and what value that we have inserted it wrongly into the formula.

Figure 3.7 shows formula evaluation for the value listed in table of water at 10 °C.

Formula Evaluation	Explanation
Evaluation: = INDEX(INDIRECT(C5&"!A4:L79");MATCH(B5;INDIRECT(C5&"!A4:L79")... = Data	C5 is a cell that referred to Data of water which located in the range of A4:L79 cells in water worksheet.
Evaluation: = INDEX(Data!\$A\$4:\$L\$79;MATCH(B5;INDIRECT(C5&"!A4:A79" ... = 10	B5 is a cell that referred to the value been selected or given which in this example T=10°C.
Evaluation: = INDEX(Data!\$A\$4:\$L\$79;MATCH(10;INDIRECT("Data!A4:A79";0);3)	INDIRECT function is referring to water worksheet in the range of A4:A79 cells which 10°C is located.
Evaluation: = INDEX(Data!\$A\$4:\$L\$79;MATCH(10;Data!\$A\$4:\$A\$79;0);3)	MATCH function is referring to the exact value that is equal to the value selected because we have set the MATCH type as 0.
Evaluation: = INDEX(Data!\$A\$4:\$L\$79;3,3)	INDEX Function refers to row number 3 and column number 3 which the value that we want to find is located.
Evaluation: = 42.022	Lastly, after completing the formula correctly, the answer will appear as the value of enthalpy at saturated liquid for T=10°C is equal to 42.022.

Figure 3.7: Formula Evaluation for the Value Listed In Table

3.5.2 Value of Temperature Given Not Listed In Table

In completing interpolation method using excel, we need to do interpolation method manually first. After that, we need to translate the formula created manually into excel file using excel formula. For example, given temperature are 24°C and we want to find value of enthalpy at saturated liquid for water.

3.5.3 Manual Interpolation Method

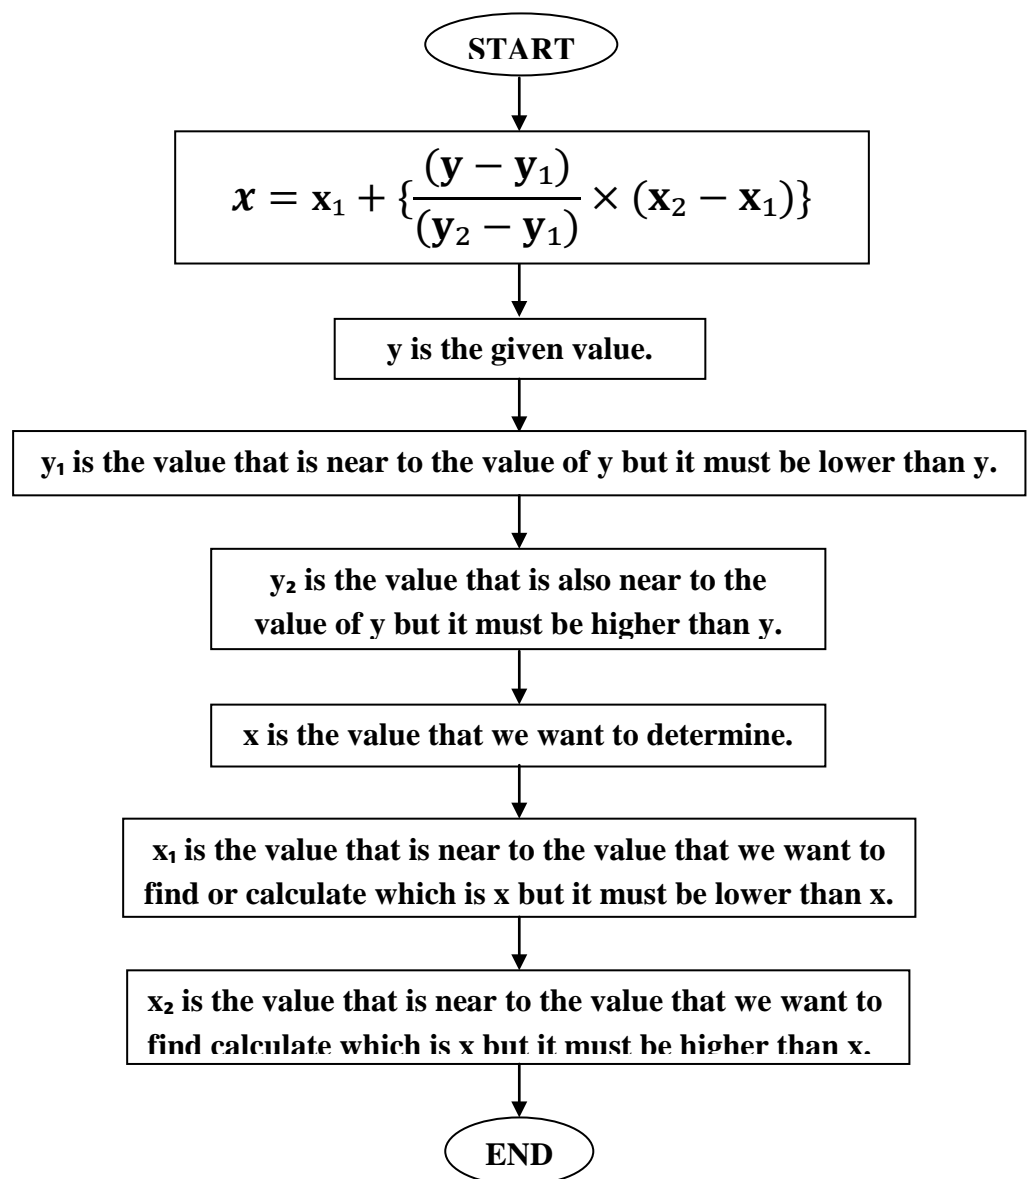

Figure 3.8: Process flow chart of creating the interpolation formula

3.5.4 Interpolation Using Excel Formula Method

Given Temperature: 24°C

Formula created using Excel formula:

```
IFERROR(INDEX(INDIRECT(B8&"!A4:L79");MATCH(A8;INDIRECT(B8&"!A4:A79");1);4)+(A8-INDEX(INDIRECT(B8&"!A4:L79");MATCH(A8;INDIRECT(B8&"!A4:A79");1);1))/(INDEX(INDIRECT(B8&"!A4:L79");1+MATCH(A8;INDIRECT(B8&"!A4:A79");1);1)-INDEX(INDIRECT(B8&"!A4:L79");MATCH(A8;INDIRECT(B8&"!A4:A79");1);1))*(INDEX(INDIRECT(B8&"!A4:L79");1+MATCH(A8;INDIRECT(B8&"!A4:A79");1);4)-INDEX(INDIRECT(B8&"!A4:L79");MATCH(A8;INDIRECT(B8&"!A4:A79");1);4)),"out of range")
```

Table 3.2 shows interface of the interpolation value for water table at 24 °C of temperature.

Table 3.2: Interface of Interpolation Value At 24°C For Water Table

Temp.	Saturation Pressure	Enthalpy		Enthalpy		Specific Heat		Thermal Conductivity	
°C	kPa	kJ/kg		kJ/kg		Cp, J/kg.K		k, W/m.K	
T	Psat	Sat. liquid,hf	Evaporator ,hfg	Sat. vapor,hg	Sat. liquid,Sf	Evaporator ,Sfg	Sat. vapor,Sg	Liquid	Vapor
24	DaTa	100.647	2444.06	2544.68	0.35306	8.22552	8.57858	4180.4	1869.4
								0.6052	0.01852

After the formula has been created using Excel formula, Formula Evaluation is needed in order to know whether the formula we have created is right or wrong. It is also important as a guide for us if we have created wrong formula. By this formula evaluation, we can know where and what value that we have inserted it wrongly into the formula.

Figure 3.9 shows formula evaluation for the value not listed in table of water at 24°C.

Formula Evaluation	Explanation
Evaluation: = IFERROR(INDEX(INDIRECT(C5&"!A4:L79");MATCH(B5;INDIRE... = Data	C5 is a cell that referred to Data of water which located in the range of A4:L79 cells in water worksheet.
Evaluation: = IFERROR(INDEX(Data!\$A\$4:\$L\$79;MATCH(B5;INDIRECT(C5&... = 24	B5 is a cell that referred to the value been selected or given which name as y For this example T=24°C.
Evaluation: = IFERROR(83.915+(B5-INDEX(INDIRECT(C5&"!A4:L79");MATC...	83.915 referred to the value of x1 which is the value of enthalpy at saturated liquid.
Evaluation: = IFERROR(83.915+(24-20)/(INDEX(INDIRECT(C5&"!A4:L79"	20 referred to the value of y1 which is the value of temperature.
Evaluation: = IFERROR(83.915+4/(25-INDEX(INDIRECT(C5&"!A4:L79");	25 referred to the value of y2 which is the value of temperature.
Evaluation: = IFERROR(83.915+0.8*(104.83-INDEX(INDIRECT(C5&"!A4:L79"	104.83 referred to the value of x2 which is the value of enthalpy at saturated liquid.
Evaluation: = 100.647	Lastly, after combining all the known values and completing the formula, the answer of the interpolation method will appear as the value of enthalpy at saturated liquid for T=24°C is equal to 100.647 kJ/kg.

Figure 3.9: Formula Evaluation for the Value Not Listed In Table

3.6 Double Interpolation for Superheated Vapor Properties

In completing double interpolation method using excel, manual interpolation method is needed first. After that, all the formula created manually need to be translated into excel file using excel formula. For double interpolation, all the methods that been used are the same as single interpolation mention before, but it needs twice of interpolation. There are three steps in completing this double interpolation. First, focus on temperature interpolation values for pressure that nearer but lower than pressure given. Second, focus on the temperature interpolation values for the pressure that nearer but higher than the pressure given. Lastly, with the new values of properties from the temperature interpolation, proceed to the pressure interpolation. For example, given temperature 505°C, given pressure 26 MPa and the value of enthalpy at saturated liquid for water is to be determined.

Formula created using Excel formula:

=IF(K60=L60;K60;K60+((H60-I60)/(J60-I60))*(L60-K60)

3.7 Interface of Water

Table 3.3 shows interface of the three different value for water table which are first for the exact value, second for the interpolation value and lastly for the value that is not in the range of the temperature values.

Table 3.3: Interface of Water

**A SIMPLIFICATION OF READING
THERMODYNAMIC PROPERTIES TABLE**

Temp.	Saturation Pressure	Enthalpy				Entropy		Specific Heat		Thermal Conductivity	
°C	kPa	kJ/kg				kJ/kg		Cp, J/kg.K		k, W/m.K	
T	Psat	Sat. liquid,hf	Evaporator, hfg	Sat. vapor,hg	Sat. liquid,sf	Evaporator, sfg	Sat. vapor,sg	Liquid	Vapor	Liquid	Vapor
5	DaTa	21.020	2489.10	2510.10	0.07630	8.94870	9.02490	4205.0	1857.0	0.5710	0.01730
24	DaTa	100.647	2444.06	2544.68	0.35306	8.22552	8.57858	4180.4	1869.4	0.6052	0.01852
380	DaTa	out of range	out of range	out of range	out of range	out of range	out of range	out of range	out of range	out of range	out of range

Table 3.8 shows an interface of a simplification of reading thermodynamic properties table. It consist of three rows of different value of temperature which the first row shows the value of temperature that is listed in the table, second row shows the value of temperature that is not listed in the table and the last row shows the value of temperature that is not in the range of temperature value. The range of the temperature value for water table is from 0.01 to 373.95°C. Refer to the last row in the interface, the value of 380°C is higher than the highest value 373.95°C, so the result will be “out of range”.

CHAPTER 4

RESULTS AND DISCUSSIONS

4.1 INTRODUCTION

In this chapter, the results from the study will be analyzed. The comparison between the values of properties from the interface created using excel with the values of properties from the book of thermodynamic properties table in order to do the data validation.

4.2 RESULT OF EXACT VALUES FROM WATER TABLE

Table 4.1 shows an interface of a simplification of reading thermodynamic properties table using excel software for water properties.

Table 4.1: Interface Exact Values of Water

Temp.	Enthalpy				Entropy		Specific Heat		Thermal Conductivity		Internal Energy		
°C	kJ/kg				kJ/kg.K		Cp, J/kg.K		k, W/m.K		kJ/kg		
T	Sat. liquid, hf	Evaporator, hfg	Sat. vapor, hg	Sat. liquid, sf	Evaporator, sfg	Sat. vapor, sg	Liquid	Vapor	Liquid	Vapor	Sat. liquid, Uf	Evaporator, Ufg	Sat. vapor, Ug
5	21.02	2489.10	2510	0.076	8.9487	9.025	4205	1857	0.571	0.017	21.02	2360.8	2381.8
50	209.3	2382.00	2591	0.704	7.3710	8.075	4181	1900	0.644	0.020	210.2	2233.9	2443.9
95	398.1	2269.60	2668	1.250	6.1647	7.415	4212	2010	0.677	0.025	399.4	2107.0	2506
140	589.2	2144.30	2734	1.739	5.1901	6.929	4286	2244	0.683	0.030	588.5	1980.1	2568.1
185	785.2	1996.20	2781	2.188	4.3572	6.545	4435	2650	0.671	0.037	777.7	1853.2	2630.2

It consists of five rows of different exact values of temperature that are listed or can be obtained directly from the water properties table. Data validation is done by comparing the values of all properties obtained from the interface above with the values of all properties from the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Figure 4.1 shows the amount of enthalpy against the temperature of water. The relationship between temperature and enthalpy is directly proportional. The amount of enthalpy increases in uniform manner as the temperature of water increases. The amount of enthalpy is lowest (21.02 kJ/kg) results to temperature 5°C. When the temperature hits 185 °C, the amount of enthalpy reaches its highest point which is 785.19kJ/kg.

Figure 4.1: Graph of Enthalpy Versus Temperature with Exact Values of Water

4.3 RESULT OF EXACT VALUES FROM AIR TABLE

Table 4.2 shows an interface of a simplification of reading thermodynamic properties table using excel software for air properties.

Table 4.2: Interface of Exact Values of Air

Temp.	Enthalpy	Entropy	Relative Pressure	Relative Specific Volume	Internal Energy
K	kJ/kg	kJ/kg.K			kJ/kg
T	h	s	Pr	Vr	U
200	199.97	1.2956	0.3363	1707	142.56
400	400.98	1.9919	1.9587	301.6	327.94
600	607.02	2.409	3.2067	105.8	470.54
800	821.95	2.7179	4.3299	48.08	598.88
1000	1046.04	2.9677	4.9539	25.17	670.18

It consists of five rows of different exact values of temperature that are listed or can be obtained directly from the airproperties table. Data validation is done by comparing the values of all properties obtained from the interface above with the values of all properties from the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Figure 4.2 shows the amount of enthalpy against the temperature of air. The relationship between temperature and enthalpy is directly proportional. The amount of enthalpy increases in uniform manner as the temperature of air increases. The amount of enthalpy is lowest (199.97 kJ/kg) results to temperature 200 K. When the temperature hits 1000 K, the amount of enthalpy reaches its highest point which is 1046.04 kJ/kg.

Figure 4.2: Graph of Enthalpy Versus Temperature with Exact Values of Air

4.4 RESULT OF EXACT VALUES FROM SUPERHEATED VAPOR TABLE AT CONTANT PRESSURE

Table 4.3 shows an interface of a simplification of reading thermodynamic properties table using excel software for superheated vapor at constant pressure properties.

Table 4.3: Interface of Exact Values of Superheated Vapor at Constant Pressure

Temp.	Pressure	Enthalpy	Entropy	Specific Volume	Internal Energy
°C	MPa	kJ/kg	kJ/kg.K	m ³ /kg	kJ/kg
T	P	h	s	v	U
400	40	1931.4	4.1145	0.001911	1855.0
500	40	2906.5	5.4744	0.005623	2681.6
600	40	3350.4	6.0170	0.008089	3026.8
700	40	3679.2	6.3740	0.009930	3282.0
800	40	3972.6	6.6613	0.011521	3511.8

It consists of five rows of different exact values of temperature and five rows of constant exact values of pressure that are listed or can be obtained directly from the superheated vapor properties table. Data validation is done by comparing the values of all properties obtained from the interface above with the values of all

properties from the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Figure 4.3 shows the amount of enthalpy against temperature for superheated vapor at constant pressure (40 MPa). The relationship between temperature and enthalpy is directly proportional. The amount of enthalpy increases in uniform manner as the temperature of superheated vapor increases. The amount of enthalpy is lowest (1931.4 kJ/kg) results to temperature 400 °C. When the temperature hits 800 °C, the amount of enthalpy reaches its highest point which is 3972.6 kJ/kg.

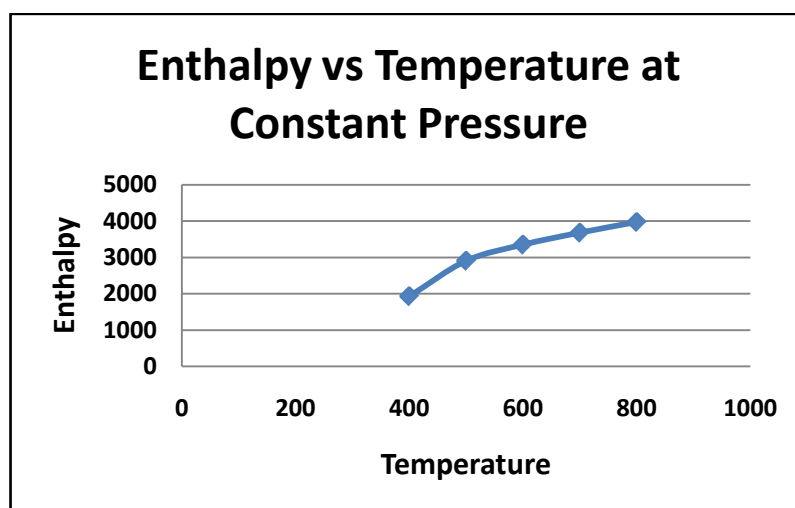

Figure 4.3: Graph of Enthalpy Versus Temperature with Exact Values of Superheated Vapor at Constant Pressure

4.5 RESULT OF EXACT VALUES FROM SUPERHEATED VAPOR TABLE AT CONTANT TEMPERATURE

Table 4.4 shows an interface of a simplification of reading thermodynamic properties table using excel software for superheated vapor at constant temperature properties.

Table 4.4: Interface of Exact Values of Superheated Vapor at Constant Temperature

Temp.	Pressure	Enthalpy	Entropy	Specific Volume	Internal Energy
K	MPa	kJ/kg	kJ/kg.K	m ³ /kg	kJ/kg
T	P	h	s	v	U
400	5	3196.7	6.6483	0.0578	2907.5
400	10	3097.5	6.2141	0.0264	2833.1
400	15	2975.7	5.8882	0.0157	2740.6
400	20	2816.9	5.5526	0.0100	2617.9
400	25	2578.7	5.1400	0.0060	2428.5

It consists of five rows of different exact values of pressure and five rows of constant exact values of temperature that are listed or can be obtained directly from the superheated vapor table. Data validation is done by comparing the values of all properties obtained from the interface above with the values of all properties from the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Figure 4.4 shows the amount of enthalpy against pressure of superheated at constant temperature (400°C). The pattern of the graph shown is indirectly proportional. The pressure increases while the enthalpy decreases. At the lowest pressure for superheated vapor of water (5MPa), the amount of enthalpy is 3196.7 kJ/kg. The enthalpy of superheated vapor then decreases uniformly until it each its lowest value which is 2578.7 kJ/kg at 25Mpa.

Figure 4.4: Graph of Enthalpy Versus Pressure with Interpolation Values of Superheated Vapor at Constant Temperature

4.6 RESULT OF INTERPOLATION VALUES FROM INTERFACE OF WATER

Table 4.5 shows an interface of a simplification of reading thermodynamic properties table using excel software for water properties.

Table 4.5: Interface of Interpolation of Water

Temp.	Enthalpy					Entropy		Specific Heat		Thermal Conductivity		Internal Energy		
°C	kJ/kg					kJ/kg.K		Cp, J/kg.K		k, W/m.K		U, kJ/kg		
T	Sat. liquid, hf	Evaporator, hfg	Sat. vapor, hg	Sat. liquid, sf	Evaporator, sfg	Sat. vapor, sg	Liquid	Vapor	Liquid	Vapor	Sat. liquid, Uf	Evaporator, Ufg	Sat. vapor, Ug	
20	83.92	2453.50	2537.4	0.297	8.3696	8.666	4182.0	1867.0	0.5980	0.0182	84.1	2318.50	2402.5	
24	100.65	2444.06	2544.7	0.353	8.2255	8.579	4180.4	1869.4	0.6052	0.0185	100.9	2307.22	2408.0	
25	104.83	2441.70	2546.5	0.367	8.1895	8.557	4180.0	1870.0	0.6070	0.0186	105.1	2304.40	2409.4	

For example the desired temperature is 24°C and the enthalpy value is the value that must be determine. From the table of interface above, the value of enthalpy at 24 °C is 100.65 kJ/kg. Data validation is done by comparing the values of

enthalpy from the table 4.5above with the value of enthalpy from the manual calculation that referred to the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Manual Calculation

$$x = x_1 + \left\{ \frac{(y - y_1)}{(y_2 - y_1)} \times (x_2 - x_1) \right\} \quad \text{Eq (4.1)}$$

At 24°C,

$$x_1=83.915\text{kJ/kg}, x_2=104.830\text{kJ/kg}, y=24^\circ\text{C}, y_1=20^\circ\text{C}, y_2=25^\circ\text{C}$$

Where x is the value of enthalpy and y is the value of temperature

$$x = 83.915 + \left\{ \frac{(24 - 20)}{(25 - 20)} \times (104.830 - 83.915) \right\}$$

$$=100.67\text{kJ/kg}$$

The value of enthalpy from the manual calculation is equal to 100.67kJ/kg and it is the same as the value of enthalpy from the table 4.5above. So, it proved that the value of the enthalpy from the table of interface of water above is valid.

4.7 RESULT OF INTERPOLATION VALUES FROM INTERFACE OF AIR

Table 4.6 shows an interface of a simplification of reading thermodynamic properties table using excel software for air properties.

Table 4.6: Interface of Interpolation of Air

Temp.	Enthalpy	Entropy	Relative Pressure	Relative Specific Volume	Internal Energy
K	kJ/kg	kJ/kg.K			kJ/kg
T	H	s	Pr	Vr	U
200	199.97	1.29559	0.3363	1707	142.56
205	204.97	1.32002	0.3675	1609.5	146.125
210	209.97	1.34444	0.3987	1512	149.69

For example, the desired temperature is 205 K and the enthalpy value is the value that must be determine. From the table of interface above, the value of enthalpy at 205 K is 204.97kJ/kg. Data validation is done by comparing the values of enthalpy from the table 4.6above with the value of enthalpy from the manual calculation that referred to the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Manual Calculation

At 205K,

Refer to Eq (4.1),

$$x_1=199.97\text{kJ/kg}, x_2=209.97\text{kJ/kg}, y=205\text{K}, y_1=200\text{K}, y_2=210\text{K}$$

Where x is the value of enthalpy and y is the value of temperature.

$$x = 199.97 + \left\{ \frac{(205 - 200)}{(210 - 200)} \times (209.97 - 199.97) \right\}$$

$$=204.97\text{kJ/kg}$$

The value of enthalpy from the manual calculation is equal to 204.97kJ/kg and it is the same as the value of enthalpy from the table 4.6 above. So, it proved that the value of the enthalpy from the table of interface of air above is valid.

4.8 RESULT OF INTERPOLATION VALUES FROM INTERFACE OF SUPERHEATED VAPOR AT CONSTANT PRESSURE

Table 4.7 shows an interface of a simplification of reading thermodynamic properties table using excel software for superheated vapor at constant pressure properties.

Table 4.7: Interface of Interpolation of Superheated Vapor at Constant Pressure

Temp.	Pressure	Enthalpy	Entropy	Specific Volume	Internal Energy
°C	Mpa	kJ/kg	kJ/kg.K	m ³ /kg	kJ/kg
T	P	h	s	v	U
400	15	2975.70	5.8882	0.01567	2740.60
435	15	3103.24	6.0668	0.01764	2838.74
450	15	3157.90	6.1434	0.01848	2880.80

For example, the desired temperature is 435 K and the enthalpy value is the value that must be determine. From the table of interface above, the value of enthalpy at 435 K is 3103.24 kJ/kg. Data validation is done by comparing the values of enthalpy from the table 4.7 above with the value of enthalpy from the manual calculation that referred to the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Manual Calculation

Refer to Eq (4.1),

$$x_1=2975.7\text{kJ/kg} , x_2=3157.9\text{kJ/kg} , y=435^\circ\text{C} , y_1=400^\circ\text{C} , y_2=450^\circ\text{C}$$

Where x is the value of enthalpy and y is the value of temperature.

$$x = 2975.7 + \left\{ \frac{(435 - 400)}{(450 - 400)} \times (204.97 - 2975.7) \right\}$$

$$=3103.24 \text{ kJ/kg}$$

The value of enthalpy from the manual calculation is equal to 3103.24kJ/kg and it is the same as the value of enthalpy from the table 4.7 above. So, it proved that the value of the enthalpy from the table of interface of superheated vapor above is valid.

4.9 RESULT OF INTERPOLATION VALUES FROM INTERFACE OF SUPERHEATED VAPOR AT CONSTANT TEMPERATURE

Table 4.8 shows an interface of a simplification of reading thermodynamic properties table using excel software for air at constant temperature properties.

Table 4.8: Interface of Interpolation of Superheated Vapor at Constant Temperature

Temp.	Pressure	Enthalpy	Entropy	Specific Volume	Internal Energy
$^\circ\text{C}$	MPa	kJ/kg	kJ/kg.K	m ³ /kg	kJ/kg
T	P	h	s	v	U
400	25	2578.70	5.140	0.006005	2428.50
400	27	2408.34	4.874	0.004722	2284.66
400	30	2152.80	4.476	0.002798	2068.90

For example, the desired pressure is 27 MPa and the enthalpy value is the value that must be determine. From the table of interface above, the value of enthalpy at 27 MPa is 2408.34 kJ/kg. Data validation is done by comparing the values of enthalpy from the table 4.8 above with the value of enthalpy from the manual calculation that referred to the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Manual Calculation

Refer to Eq (4.1),

$$x = x_1 + \left\{ \frac{(y - y_1)}{(y_2 - y_1)} \times (x_2 - x_1) \right\}$$

$$x_1=2578.70\text{kJ/kg} , x_2=2152.80\text{kJ/kg} , y=27^\circ\text{C} , y_1=25^\circ\text{C} , y_2=30^\circ\text{C}$$

Where x is the value of enthalpy and y is the value of temperature.

$$x = 2578.70 + \left\{ \frac{(27 - 25)}{(30 - 25)} \times (2152.80 - 2578.70) \right\}$$

$$=2408.34 \text{ kJ/kg}$$

The value of enthalpy from the manual calculation is equal to 2408.34 kJ/kg and it is the same as the value of enthalpy from the table 4.8 above. So, it proved that the value of the enthalpy from the table of interface of superheated vapor above is valid.

4.10 RESULT OF INTERPOLATION VALUES FROM INTERFACE OF SUPERHEATED VAPOR

Table 4.9 shows an interface of a simplification of reading thermodynamic properties table using excel software for superheated vapor.

Table 4.9: Interface of Interpolation of Superheated Vapor

Temp.	Pressure	Enthalpy	Entropy	Specific Volume	Internal Energy
°C	MPa	kJ/kg	kJ/kg.K	m ³ /kg	kJ/kg
T	P	h	s	v	U
500	25	3165.90	5.96430	0.01114	2887.30
525	27	3224.43	6.01095	0.01094	2932.13
550	30	3279.70	6.04030	0.01018	2974.50

For example, the desired temperature is 525 K and pressure is 27 MPa, finally the enthalpy value is the value that must be determine. From the table of interface above, the value of enthalpy at 525 °C and 27 MPa is 2408.34 kJ/kg. Data validation is done by comparing the values of enthalpy from the table 4.9 above with the value of enthalpy from the manual calculation that referred to the book of thermodynamic properties table. If the values of both compared are the same, so that the values from the interface above are valid.

Manual Calculation

Step 1: Focus on Temperature Interpolation for T=525°C at P=25MPa,

Refer to Eq (4.1),

$$x_1=3165.9 \text{ kJ/kg} , x_2=3339.2 \text{ kJ/kg} , y=525^\circ\text{C} , y_1=500^\circ\text{C} , y_2=550^\circ\text{C}$$

Where x is the value of enthalpy and y is the value of temperature.

$$x = 3165.9 + \left\{ \frac{(525 - 500)}{(550 - 500)} \times (3339.2 - 3165.9) \right\}$$

$$= 3252.55 \text{ kJ/kg}$$

Step 2: Focus on Temperature Interpolation for $T=525^\circ\text{C}$ at $P=30\text{MPa}$,

Refer to Eq (4.1),

$$x_1=3084.8\text{kJ/kg} , x_2=3279.7\text{kJ/kg} , y=525^\circ\text{C} , y_1=500^\circ\text{C} , y_2=550^\circ\text{C}$$

Where x is the value of enthalpy and y is the value of temperature.

$$x = 3084.8 + \left\{ \frac{(525 - 500)}{(550 - 500)} \times (3279.7 - 3084.8) \right\}$$

$$= 3182.25 \text{ kJ/kg}$$

Step 3: Pressure Interpolation for $P=27\text{MPa}$,

Refer to Eq (4.1),

$$x_1=3252.55\text{kJ/kg} , x_2=3182.25\text{kJ/kg} , y=27^\circ\text{C} , y_1=25^\circ\text{C} , y_2=30^\circ\text{C}$$

Where x is the value of enthalpy and y is the value of temperature.

$$x = 3252.55 + \left\{ \frac{(27 - 25)}{(30 - 25)} \times (3182.25 - 3252.55) \right\}$$

$$= 3224.43 \text{ kJ/kg}$$

The value of enthalpy from the manual calculation is equal to 3224.43 kJ/kg and it is the same as the value of enthalpy from the table 4.9 above. So, it proved that

the value of the enthalpy from the table of interface of superheated vapor above is valid.

4.11 ANALYSIS OF INTERPOLATION VALUES FROM INTERFACE OF SUPERHEATED VAPOR AT CONSTANT PRESSURE

Table 4.10 shows an interface of a simplification of reading thermodynamic properties table using excel software for superheated vapor at constant pressure properties.

Table 4.10: Interface of Superheated Vapor at Constant Pressure

Temp.	Pressure	Enthalpy	Entropy	Specific Volume	Internal Energy
°C	MPa	kJ/kg	kJ/kg.K	m ³ /kg	kJ/kg
T	P	h	s	v	U
400	25	2578.7	5.14	0.00601	2428.5
435	25	2863.2	5.55284	0.0084	2653.16
470	25	3036.7	5.79126	0.00996	2787.64
505	25	3183.2	5.98603	0.0113	2900.65
540	25	3304.5	6.13814	0.01242	2994.1
575	25	3416.4	6.27265	0.01344	3080.4
610	25	3522.3	6.39582	0.0144	3162.38
645	25	3623.3	6.50824	0.0153	3240.71
680	25	3720.7	6.61184	0.01616	3316.7
715	25	3816.2	6.7095	0.01698	3391.52

Some of them are listed in the superheated vapor table but some of them are not listed in the superheated vapor table. The graphs below are just to show the pattern of the relationship between all properties with the temperature at constant pressure.

Figure 4.5 shows the amount of enthalpy against temperature of superheated vapor at constant pressure (25 Mpa). At the lowest temperature for superheated vapor (400 °C), the amount of enthalpy of water is 2578.7kJ/kg. The enthalpy of water at superheated vapor then increases uniformly until it each its highest value 3816.2 kJ/kg at 715 °C.

Figure 4.5: Graph of Enthalpy Versus Temperature with Interpolation Values of Superheated Vapor at Constant Pressure

Figure 4.6 shows the amount of entropy against temperature of superheated vapor at constant pressure (25 Mpa). At the lowest temperature for superheated vapor (400 °C), the amount of entropy is 5.14 kJ/kg.K. The entropy at superheated vapor then increases uniformly until it reaches its highest value 6.7095 kJ/kg.K at 715 °C.

Figure 4.6: Graph of Entropy Versus Temperature with Interpolation Values of Superheated Vapor at Constant Pressure

Figure 4.7 shows the amount of specific volume against temperature of superheated vapor at constant pressure (25 Mpa). At the lowest temperature for superheated vapor (400 °C), the amount of specific volume is 0.00601m³/kg. The specific volume at superheated vapor then increases uniformly until it each its highest value 0.01698 m³/kg at 715 °C.

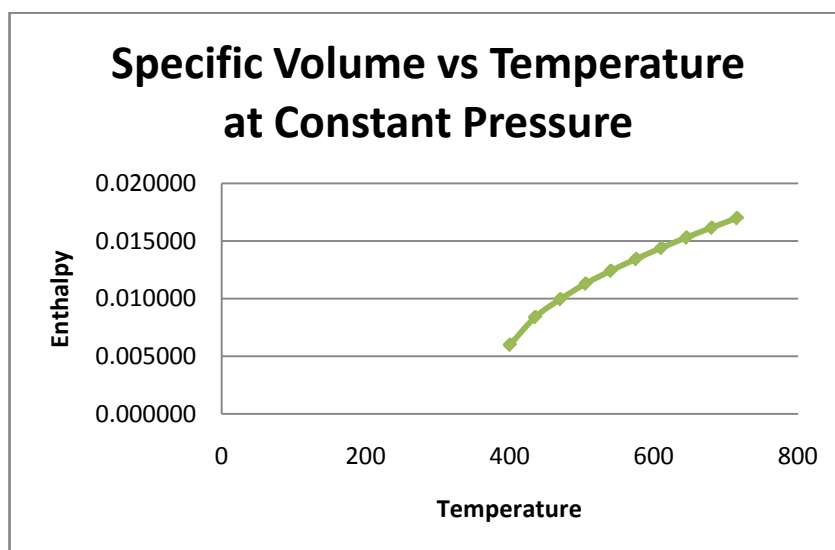

Figure 4.7: Graph of Specific Volume Versus Temperature with Interpolation Values of Superheated Vapor at Constant Pressure

Figure 4.8 shows the amount of internal energy against temperature of superheated vapor at constant pressure (25 Mpa). At the lowest temperature for superheated vapor (400 °C), the amount of internal energy is 2428.5 kJ/kg. The internal energy at superheated vapor then increases uniformly until it reach its highest value 3391.52 kJ/kg at 715 °C.

Figure 4.8: Graph of Internal Energy Versus Temperature with Interpolation Values of Superheated Vapor at Constant Pressure

4.12 ANALYSIS OF INTERPOLATION VALUES FROM INTERFACE OF SUPERHEATED VAPOR AT CONSTANT TEMPERATURE

Table 4.11 shows an interface of a simplification of reading thermodynamic properties table using excel software for superheated vapor at constant temperature properties.

Table 4.11: Interface of Superheated Vapor at Constant Temperature

Temp.	Pressure	Enthalpy	Entropy	Specific Volume	Internal Energy
°C	MPa	kJ/kg	kJ/kg.K	m ³ /kg	kJ/kg
T	P	h	s	v	U
400	5	3196.70	6.6483	0.0578	2907.50
400	8	3139.40	6.3658	0.0343	2864.60
400	11	3074.50	6.1458	0.0239	2815.70
400	14	3001.42	5.9502	0.0174	2760.20
400	17	2917.06	5.7545	0.0131	2695.56
400	20	2816.90	5.5526	0.0100	2617.90
400	23	2673.98	5.3050	0.0076	2504.26
400	26	2493.52	5.0072	0.0054	2356.58
400	29	2237.98	4.6086	0.0034	2140.82
400	32	2087.12	4.3712	0.0025	2007.30

Some of them are listed in the superheated vapor table but some of them are not listed in the superheated vapor table. The graphs below are just to show the pattern of the relationship between all properties with the temperature at constant pressure.

Figure 4.9 shows the amount of enthalpy against pressure of superheated vapor at constant temperature (400°C). The pattern of the graph shown is indirectly proportional. The pressure increases while the enthalpy decreases. At the lowest pressure for superheated vapor of water (5MPa), the amount of enthalpy is 3196.7 kJ/kg. The enthalpy of water at superheated vapor then decreases uniformly until it reaches its lowest value which is 2087.12 kJ/kg at 32Mpa.

Figure 4.9: Graph of Enthalpy Versus Temperature with Interpolation Values of Superheated Vapor at Constant Temperature

Figure 4.10 shows the amount of entropy against pressure of superheated vapor at constant temperature (400°C). The pattern of the graph shown is indirectly proportional. The pressure increases while the entropy decreases. At the lowest pressure for superheated vapor of water (5MPa), the amount of entropy is 6.6483 kJ/kg.K. The entropy of water at superheated vapor then decreases uniformly until it reaches its lowest value which is 4.3712 kJ/kg.K at 32Mpa.

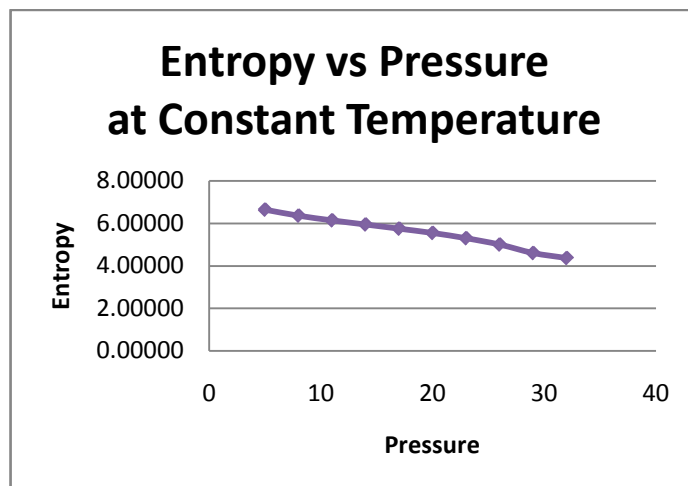

Figure 4.10: Graph of Entropy Versus Pressure with Interpolation Values of Superheated Vapor at Constant Temperature

Figure 4.11 shows the amount specific volume against pressure superheated vapor at constant temperature (400°C). The pattern of the graph shown is indirectly proportional. The graph starts with a steep slope before decrement in gradient at the middle of the graph. The graph stabilize from pressure 11 Mpa to 32 Mpa. The pressure increases while the enthalpy decreases. At the lowest pressure for superheated vapor of water (5MPa), the amount of specific volume is 0.0578 m³/kg. The specific volume at superheated vapor then decreases uniformly until it reach its lowest value which is 0.0025 m³/kg at 32 Mpa.

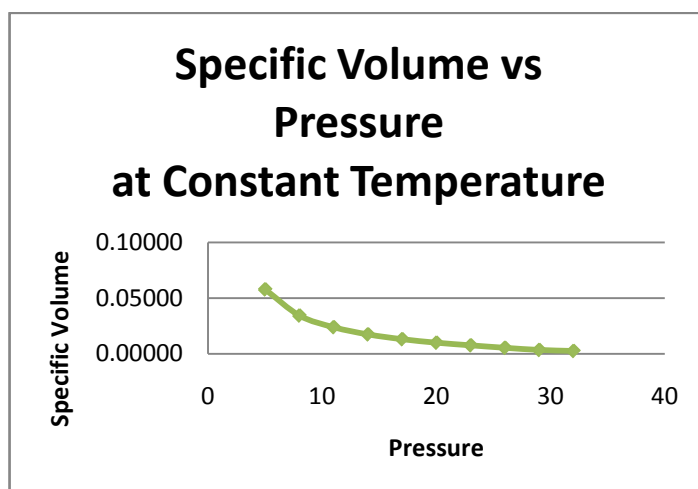

Figure 4.11: Graph of Specific Volume Versus Pressure with Interpolation Values of Superheated Vapor at Constant Temperature

Figure 4.12 shows the amount of enthalpy versus pressure of water at constant temperature (400°C). The pattern of the graph shown is indirectly proportional. The pressure increases while the enthalpy decreases. At the lowest pressure for superheated vapor of water (5MPa), the amount of enthalpy is 2907.5 kJ/kg. The enthalpy of water at superheated vapor then decreases uniformly until it reaches its lowest value which is 2007.3 kJ/kg at 32 Mpa.

Figure 4.12: Graph of Internal Energy Versus Pressure with Interpolation Values of Superheated Vapor at Constant Temperature

CHAPTER 5

CONCLUSION AND RECOMMENDATION

5.1 CONCLUSION

The main objective of this project was to develop an excel file to simply obtain thermodynamic properties without manually reading from thermodynamic properties table. The main objective was achieved by creating interface of reading thermodynamics properties table using excel file formula and software. The desired values were obtained directly from the interface created. Besides, this interface provided two ways of finding the properties values which are first, when the desired values is directly stated in the thermodynamics properties table and second, when the desired values is indirectly stated in the thermodynamics properties table and interpolation needed. Manual calculation was needed in order to validate the data obtained from the interface using excel software created.

5.2 RECOMMENDATION

After all process done in completing this project, there are several recommendations that can be added in the future research. The function of changing the units of thermodynamics properties to other standard, for example into American Standard, should be developed so that the software will become more user friendly. Besides that, several other commonly used properties, such as density and specific volume, should also be added into the software. The software should also be able to run on other operating systems such as MAC for Apple and LINUX for Linus Torvalds so that people using other operating systems will have the benefits of using the software.
