

**STUDY ON WATER QUALITY OF THE TASIK TITIWANGSA, KUALA
LUMPUR, MALAYSIA**

NUR IZZATI BT MAT ZIN

Report submitted in partial fulfillment of the requirements
For the award of the degree of
Bachelor of Civil Engineering

Faculty of Civil Engineering and Earth Resources
UNIVERSITI MALAYSIA PAHANG

JANUARY 2014

ABSTRACT

The purposes of the study was to determine the current water quality status of the Tasik Titiwangsa (Titiwangsa Lake) and to obtain the water quality classified based on Interim National Water Quality Standard (INWQS) for Malaysia and Water Quality Index (WQI) of the selected sampling station. A total of six sampling station were selected for this study which were named as station 1, 2, 3, 4, 5 and 6. Sixteen water quality parameters were analyzed based on in-situ and ex-situ analysis at the sample were collected on September, October and November. Laboratory analysis was carried out according to the standard method. In-situ water quality parameters were such as pH, dissolve oxygen, electrical conductivity, turbidity, temperature and TDS. For ex-situ water quality parameters included TSS, ammoniacal nitrogen, COD, BOD, nitrate, phosphate, sulphate, total coliform, E-coli and oil and grease. The result showed that the water quality of the Tasik Titiwangsa was classified as Class III based on WQI which suitable for recreational activities and body contact. However, the activities such as wedding ceremony, water sports and equestrian sports venue have taken place in surrounding of the lake consequently affected the water body of Tasik Titiwangsa and it might be cause of the lake pollution and some further action must be considered for the best in future.

ABSTRAK

Tujuan kajian ini ialah untuk menentukan status kualiti air semasa Tasik Titiwangsa (Titiwangsa Lake) dan untuk mendapatkan kualiti air dikelaskan berdasarkan INWQS (Interim National Standard Kualiti Air) bagi Malaysia dan WQI (Indeks Kualiti Air) pada stesen persampelan yang ditentukan. Sebanyak enam stesen persampelan telah dipilih untuk kajian ini yang dinamakan sebagai stesen 1, 2, 3, 4, 5 dan 6. Enam belas parameter kualiti air telah dianalisis berdasarkan in-situ dan analisis ex-situ di akhir bulan September, Oktober dan November. Analisis makmal dijalankan mengikut kaedah Standard. In-situ kualiti air termasuk nilai pH, oksigen terlarut (DO), kekonduksian elektrik (EC), kekeruhan dan suhu, manakala untuk analisis makmal termasuk jumlah pepejal terampai (TSS), ammonikal nitrogen (AN), permintaan oksigen kimia (COD), permintaan oksigen biologi (BOD), nitrat, fosfat, sulfat, jumlah koliform dan E- coli. Berdasarkan Indeks Kualiti Air (WQI), air di Tasik Titiwangsa diklasifikasikan sebagai kelas III yang mana sesuai untuk aktiviti rekreasi dan hubungan badan. Walau bagaimanapun, aktiviti-aktiviti seperti majlis perkahwinan, sukan air dan tempat sukan berkuda terdapat dan telah berlaku disekitar tasik dan ia mungkin menjadi punca pencemaran tasik dan beberapa tindakan lanjut perlu dipertimbangkan untuk yang terbaik pada masa akan datang.

CHAPTER 1

INTRODUCTION

1.1 Introduction

Water is one of the natural resource that has many functions. The survival of humans, animals and plants depend on this resource. However, without other valuable components like hydrogen and oxygen, there can't be any life on the earth because generally the existence of all of this grows and changes according to its nature.

Water can be obtained from various sources such as rivers, lakes, sea, ponds and also groundwater resource. Approximately 70% of the earth consists of water but only 2% of the water can be used as drinking water. Sea is the major source of the water, but due to the high soluble salt content making it unsuitable for the human consumption. Lakes are the unique water bodies that have high water quality properties that make it a high valued resource to society and nature. There are two kinds of lakes which are natural lake and artificial lake. Many lakes in the Malaysia are fresh water like Tasik Bera, Tasik Chini, Tasik Chenderoh and etc. and there are also artificial that that are constructed for hydro-electric power generation, aesthetic purposes, recreational purposes, industrial use, agricultural use or domestic water supply. For example, Tasik Titiwangsa in Kuala Lumpur, Malaysia is one of the artificial lakes that created for recreational purpose. It is popular among the local citizen because of its close proximity to the city centre. Since there are many recreations activity are

organized there like fishing contest, wedding, sports activities and etc; the water quality of the lake will be degraded because of the pollutions.

Even though water is a valuable resource but human sometimes practices hand-off attitude and lack of awareness to protect and conserve this resource. Therefore the water can easily be polluted due to the irresponsible human actions. As be known, water pollution will disrupt ecosystems in the rivers or lakes. The pollution of the water will cause the aquatic die or at least contaminants will enter the food chain. If there is content of pollution in the aquatic bodies such as fish and humans eat the fish, it will cause problems in term of health. Besides that, the effects of the pollution will also cause the change in the aesthetic value of the water. The distortions that can be seen are in terms of turbidity, colour and the odour of the water. In general it is known that the level of turbidity and the level of pollution in natural lake are lower compared to the artificial lake since the quantity of water is higher and it is able to receive and eliminate the pollution.

1.2 Background of Tasik Titiwangsa

Situated in the north-eastern part of Kuala Lumpur which is beside the Jalan Tun Razak, the Titiwangsa Lake Gardens is a kid-friendly attraction and a famous meeting place for city folks. Titiwangsa Lake Garden is a large recreational park highlighted by a lake at the middle where many activities can be done.

Taman Tasik Titiwangsa has an area of 46.13 hectares or 114 acres located 3 miles from the city centre officially opened on February 1, 1980 by the late Tun Hussein Onn. Around the Titiwangsa Lake Gardens are the National Library, Restaurant Nelayan, National Art Gallery, National Theatre (Istana Budaya) and the Sutra Dance Theatre.

Taman Tasik Titiwangsa is an artificial lake that is constructed for a recreations reason offers outdoor facilities such as children's playground, tennis courts, water sports, tracks for jogging, walking or cycling, exercise area and a floating restaurant at the edge of the lake. Since there are many facilities there, apart from recreational

activities, sometimes there is other event that is organized there like wedding ceremony. Figure 1.1 shows the location of Titiwangsa Lake Garden.

Land use around the Titiwangsa Lake is clearly shown in Figure 1.2 (in Appendix A). Land use of waterbody is important because it will affect the quality of the water. The water of Tasik Titiwangsa is flowing from Lake 2 to Lake 1 since it consists of two lakes that connecting together. Basically, most of the water activities are being done at Lake 1 which is the main lake located near the management office.

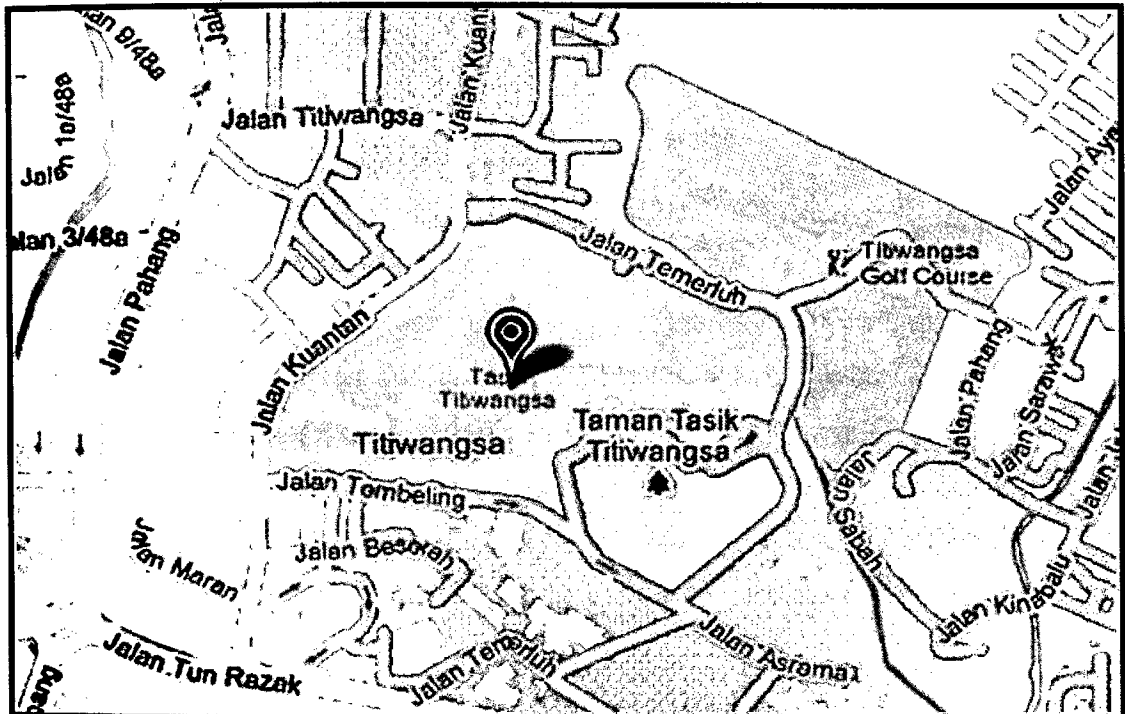

Figure 1.1: Location of Titiwangsa Lake Garden

Source: google.com

1.3 Problem Statement

The water is widely used nowadays and it is not focused on the use of daily needs only but also extends to recreational purposes like swimming, kayaking, diving and many other water-based recreational activities. Therefore, the water quality in a recreation park-specification should meet certain specifications to ensure it does not cause harm to the users.

Thus, the level of water quality at Taman Tasik Titiwangsa should be monitored and maintained in order to create safe environment to the users. The level of water quality at this recreational centre is supposed to be according to the standards and classification of water to allow a secure protection for recreational use. According to the Interim National Water Quality Standard (INWQS), the water for recreational purposes is classified as Class IIB for recreational use with body touching and sensitive aquatic species. This research will review and study the quality of water in the Titiwangsa Lake that is used to as water recreational centre.

1.4 Research Objectives

Based on the research, there are a few things that have to be studied and analysed. Two objectives are expected in the end of the research:

- I. To determine current water quality status of the Tasik Titiwangsa.
- II. To classify the water quality based on Interim National Water Quality Standard (INWQS) for Malaysia and Water Quality Index Department of Environment (WQI-DOE).

1.5 Scope of Study

The scope in this research is to focus on the water quality at Titiwangsa Lake. The samples of water at Titiwangsa Lake are collected for the testing to determine the level of water quality there. Six stations are chosen to collect the sample of water at Titiwangsa Lake. This study consists of two types of test which are in-situ and laboratory testing (ex-situ). The laboratory testing is conducted to determine the physical, chemical and biological condition of the water samples based on the parameter tested. Water quality data are used to determine whether the water quality status of clean, moderately polluted or contaminated which can be determined by the class specified by the WQI-DOE and INWQS. The water quality index is calculated based on the parameters that are stated in Chapter 3.

taken in order to protect and preserve the water resource from the pollution since the water is very important in the daily life.

2.2 Lake

A lake can be define as “a body of relatively still water of considerable size, localized in a basin, that is surrounded by land apart from a river, stream, or other form of moving water that serves to feed or drain the lake” (Wikipedia, 2013). Lake is one of water resources that are available in Malaysia instead of sea and river which extensively being used for many different reasons. There are two types of lake which are natural lake (freshwater lake) and artificial lake (man-made lake). Generally, natural lakes are found in mountainous areas which form as an apart of swamp and wetland and there are a few naturally lake in Malaysia like Tasik Bera (Pahang), Tasik Chenderoh (Perak), Tasik Paya Bungor (Pahang), Tasik Chini (Pahang) and Tasik Ulu Lepar (Pahang). Many lakes in Malaysia are artificial and constructed for hydro-electric power generation, recreational purposes, industrial use, agricultural use or domestic water supply for example Tasik Titiwangsa, Tasik Putrajaya, Tasik Perdana, Tasik Pedu, Tasik Kenyir, Tasik Temenggor and etc. There are numerous features of lake such as drainage basin, inflow and outflow, nutrient content, dissolve oxygen, pollutants, pH, and sedimentation. This study is conducted to measure these features of Titiwangsa Lake. Basically, human activities around the lake will change the condition of the lake and indirectly pollute the water in the lake. Therefore, water quality of the Titiwangsa Lake need to be measured in order to ensure that it safe for recreational purposes.

2.3 Water Pollution

A healthy environment is a key factor for a better life. Nowadays, the world is getting polluted and this pollution will give negative effect to the human health as well as causing the earth become imbalanced in the future. The rapid developments of industrial activity recently not only bring development to the country but it also gives some side effects if there are unplanned developments. This is due to the developments

that are carried out without the preservation of the environment. Environmental pollution is including contamination of soil, air, water and noise. Environmental pollution means unwanted changes to the environment, where it is the result of human action, through the effect of directly or indirectly, to changes in energy patterns, radiation levels, and chemical physical formation and increase the organism (Cornwell and Davis, 1991).

Water pollution is a major global issue that is leading worldwide cause of deaths and diseases. The contamination of water body is called water pollution. It occurs when the pollutants are directly or indirectly discharged into the water bodies without adequate treatment to remove harmful compounds. The pollution of the water not only damages the individual species and populations but also harm the natural biological communities. The major cause of water pollution problem is human activities which can produce the bodily wastes into the water bodies. Apart from that, natural activities for example volcanoes, algae blooms, storms, earthquakes and etc also can pollute the water. Water is considered polluted when its quality or composition gets changed either naturally or due to the human activities and it becomes less suitable for drinking, wildlife or other uses. The ecological status of the water also will change.

The water pollution can be classified as two sources which are groundwater pollution and surface water pollution. Ground water pollution is referred to the groundwater contamination and it may not directly affect the surface of water bodies. The groundwater contamination can be focus on the soil characteristics and site geology, hydrogeology, hydrology and the natural contaminations. The surface water pollution can be grouped into two categories based on their origin which are point sources (PS) and non-point sources (NPS). PS is the pollution that is originates from a single identifiable source like pipe, ditch or well. There are various types of point source pollutants like discharge from sewage treatment plant, a factory or city storm drain. On the other hand, NPS pollution refers to diffuse contamination that does not originate from a single source. Usually, NPS pollution is the cumulative effect of small amounts of contaminants gathered from a large area. The example of NPS pollution is leaching out of nitrogen compound from fertilized agricultural land, urban runoff, contaminated storm water washed off of parking lots and etc.
